#### MANUAL OF OFFICE PROCEDURE

#### I -PRELIMINARY

Extent of use —This Manual is primarily intended for use in the office of the Agent to the Governor General and Chief Commissioner "The same procedure should be adopted, as far as may be suitable, in the offices of the Political Agents and Residents, but, as their offices are smaller, the procedure will, in certain respects, be automatically simplified, in applying the Manual to the offices of Political Agents or Residents, necessary changes should be made, e.g., for "Agent to the Governor-General" or "Secretary" the words "Resident" or "Political Agents or should be read, and for "Registrar" or "Superintendent 'the words 'Hend Clerk' should be read

- 2 Definitions—(a) The term "Secretary" includes "Under Secretary with reference to branches of the office under the Under Secretary, unless the context appears from the context
- (b) The term "Head Clerk" in the rules means the Superintendent, Head Clerk or Senior Clerk in charge of a branch, unless the contrary appears from the context.
- (c) The term " branch clerk " means a clerk under a head clerk as defined above
- (d) The "P U C" means the first or latest receipt in the course of a correspondence upon which action has to be taken.
- (c) A 'file" consists of papers which are or have been under consideration and any notes written in connection with them
  - (f) A ' current file" or " pending file" is a file which has not been closed
- (g) I "case" consists of a current file, and any files, books, etc., put up for reference with it
- (h) The "sulject" of a file or case is the major, minor and sub heads under which it is registered and indexed
- (i) A "receipt" means a communication received from outside the office or branch, and may include a note from the Agent to the Governor General or Secretary which has to be added to a jending file or on which a new file has to be opened.

#### II - ATTINDANCE, HOLIDAYS AND CASUAL LEAVE.

- 3 Office hours—The pre-cribed office fours are from 10-30 A M to 5-0 r M lut a clerk may be required by the Registrar to work beyond those hours if necessare
- 4 Leave Applications for leave must be submitted through the Registrant to the Secretary in sufficient time to enable the latter to issue onle granting or refusing it before the leave is to begin. Any one absent first NEVICER

that two days on the plan of illness must submit a medical certificate. Iffn sain a family will not ordinarily be considered a sufficient reason for granting larve, unless the seckness is infectious in the latter case the Registrateshould at once notify the medical officers of that be can visit the house and verify the information if he has not already done so

5 Gazetted Holidays—Gazetted holidays will ordinarily be allowed to the classes mentioned in the notification issued each year but clerk smay be required to work on gazetted holidays by the Secretary in necessary. The Secretary may grant a "compensation" holiday to any clerk required to a secretary may grant a "compensation" holiday to any clerk required to a secretary may grant a "compensation" holiday to any clerk required to a secretary may grant a "compensation" holiday to any clerk required to the secretary may grant a "compensation" holiday to any clerk required holiday to

Ι., 1-4 0.71 ap. two . 88 the c nd ihorders. HOT .complaint his cutie. tion hir loave ". he ropular large to this

10 Removal of official papers —No ( the all paper out of the office or to its home without t its remission of the Registric

No clerk may tal e a copy of any portion of an official document which comes before him in his official expacity or to which he is allowed to have necess without the previous permission of the Registrar, this rule applies also to copies of notes and orders on applications or memorials

11 Cinaracter Rolls—The character rolls and service books relating to members of the elerical and mennal establishments will be lept by the Registrar in the presembed form with an alphabetical index of their names. Am cursure punishment or commendation passed on a clerk or memoral should be entered in his character roll and in the service book. The character rolls will be submitted when there is any change in the personnel of the Secretary for any remarks which the outgoing Secretary may wish to record rearring that the whole is not all the submitted when any proposals are made for promotion or the grant of a 10 crement of 13.

- 12 Certificates -No certificate may be given to any mender of the office establishment unless it is signed by the Secretary
- 13 Notes affecting Discipline or Conduct—Notes affecting office discipline or the conduct of clerks which arrise in an ordinary file should not be kept with that file but should be sent to the Registrar

#### IV —OFFICE OOCANIZATION AND SYSTEM

- 14 Object—The general object of the office or anization and system is to be rible the clerical establishment to render due assistance to the Agent to the Governor-General and the Secretares in the prompt and correct disposal of their official busines. The Agent to the Governor General and the Secretary should be relieved of unimpor ant work as far as possible and the work to be done should be distributed among the members of the staff according to their abilities and experience each laving his own particular share which should not be done a second time by another member of the staff. It is often more troublesome and more exapprating to check, correct and re do the work of a clirk who has attempted scienting beyond his competence than to do the work in the first instance, and it causes more delay as well as waste of the clerk's time and energy which implied lave been employed otherwise with advantage. Reasonable checks and safegureds agunt delays, shirking of work and the accidental loss of papers must be adopted. Care must be taken that while these are efficient, they are worth the labour expended on them.
- 15 Distribution of Work—The Agency office is divided into branches, and it e worf is distributed among the various branches according to subjects in accordance with the orders passed from time to time by the Secretary I ach I ranch will be in the charge of the Registrar, the Superintendent, a head clerk, or a senior clerk appointed for the purpose. In a small office it may be unrecessary to divide it into branches.
- 16. Head Cleft's responsibilities—The head cleft will be personally responsible for the work of the other clerks in the branch, the latter are as pointed to assert him and to releve him of comparatisely unimportant work, but I e must not expect than to do I is share of the work of the branch, he must containtly pay due attention to triung a Lim, and time and it rouble spent by him in this respect will be amply repail by the additional relief which they will ultimately give him, it is nature and extent of the work which I e ran give a porticular I ranch riberk to do and the cleaners of his superarison over the latter's work should depend in the abilities and expension over the latter's work should depend in the abilities and expension over the latter's work should into those reall upon a tranch cleft to do important work which he must ultimately do I inself. The head clerk should in like manner realise that, while it is list duty to asset and relieve the Secretary, I exist out of self-give little duties of the Secretary he should freely consult the Secretary personally if I e list early doubt as a significant of the action Let do all the latter for the count of a partie of the secretary.

When there is more than one clerk manifested the order of the initial than 1 of ellilled insured as one the clerk by the 1 of a field with thomman be alread from three time if necessarious to the work is faithed that alread are of the work is faithed that alread are of the more are the state of the stat

various clerks, but, as far as possible, a clerk should be left in charge of the same subjects continuously

17 General outline of system -The Dak will be delivered to the addressee, initialled by him and sent to the Registrar Each paper will then be sent to the branch concerned and registered If it relates to a subject of general correspondence on which there is no pending file, a fresh file will be opened and indexed and previous correspondence likely to be useful in the disposal of the paper will be obtained from the records The branch clerk will reference the papers and 'flag' the files put up for reference and, if necessary, make a precis under the instructions of the head clerk. The head clerk will note on the file It will be open to him to suggest the method of disposal The case will then be submitted to the Secretary unless it can be disposed of by the Registrar under his powers. The Secretary will either pass orders or obtain the orders of the Agent to the Governor-General A draft will then be prepared by the head clerk or by the branch clerk under his instructions and will be submitted to the Secretary, who will, if necessary, submit the draft to the Agent to the Governor General In important or intricate cases the Secretary will prepare the draft himself. After the draft is passed, it will be sent to the copying branch where the fair copy will be made and sent to the officer concerned for signature, after signature it will be sent to the despatcher for despatch The case will then be sent from the branch concerned to the record keeper who will either complete the closure of the file, if its closure has been ordered, or will keep the case till the reply expected is received or other action has to be taken

In certain cases it will be seen from what follows that this general procedure is shortened or modified

#### V -DUTIES OF THE REGISTRAR

18 General Supervision —The Registrar, in addition to being in charge of work of any particular branch assigned to him will generally supervise the despitch of business throughout the office. He should exercise his control by the inspection of the registers of files, miscellaneous correspondence and periodical returns and should occasionally examine a long pending case to see that no undue delay has occurred at any stage

He should pay particular attention to the despatch of business in the copying, despatch and record branches

point

20 Character Rolls—The Registrar will keep, in such form as may be paragraph 11) of all elaphications from the for submitting

and grant of leave to members of the clerical and menial staffs

on of t

- 21 Dak and Routine Papers.—The Registrar will see to the distribution of the Dak and will dispose of routine papers on behalf of the Secretary and the Under Secretary in accordance with such orders as may be issued from time to time.
- 22 Stationery, Forms, etc.—The Registrar will maintain stock books of stationery, and will see that economy is exercised in the use of stationery, forms and service stamps (see paragraph 113)

#### VI -OPENING THE DAK.

23 All communications will be delivered to the officer addressed, who will initial them and note the date of receipt Confidential communications will be sent direct to the Confidential Clerk. Other communications will be sent to the Registrar, who will sort them according to branches

#### VII -REGISTRATION OF PAPERS

- 24 Objects -The main objects of registration are .-
  - (a) to provide a check on delays in the despatch of business;
  - (b) to render difficult the deliberate suppression of correspondence in the office.
  - (c) to enable any papers lost to be readily replaced by reference to the persons with whom the correspondence has been carried on ,
  - (d) to facilitate the tracing of papers in the records or elsewhere in the office, and
  - (e) to facilitate the selection of records for destruction when no longer required,
- 25 Registration should never be entrusted to a junior clerk, responsible for dealing with the papers to be registered, except under the direct personal supervision of a Head Clerk, who will be personally responsible for the registration
  - 26. Registers.-Registers of correspondence will include :-
    - (a) a register of miscellaneous correspondence (Form A appended):
    - (b) a register of files (Form B appended),
    - (c) a register of periodical returns (Form C appended );
    - (d) register of judicial cases,
    - (e) register of passport applications;
    - (f) register of applications for employment; and
    - (g) any other register the maintenance of which may be ordered by the Secretary.

Separate registers (a), (b) and (c) may be lept for each branch of the office.

- 27 Except under orders in cases mentioned in paragraph 31, no correspondence should be registered in two different registers
- 28 Numbering —Except in the case of periodicals, the first column in every register of correspondence should be a serial number which in the case of (b) will be the file number, the serial numbers should run for one year only
- All correspondence relating to a case should bear a number consisting of (a) the senal number in the register and (b) letters, to distinguish (i) the branch and (ii) the register in which it is registered and (c) the year, except in the case of periodical returns for which permanent files are kept. The letters to be used to distinguish the different branches and registers are shown in Appendix II. No separate letter (b) (ii) need be used to distinguish correspondence registered in the register of files. For example, in a small office where only one regi ter of files is kept, the number to be quoted may be "65/23", in an office divided into branches the number would be "65/23", would indicate that the case related to the Political Branch and was registered in the Miscellaneous Register. The system of numbering of letters must not be altered without the approval of the Secretary.

A ote —The letters for registers and branches authorised for use in the Rajputana Agency Office are shown among the abbreviations in Appendix II

- 29 Abbreviations—In making entries in registers the abbreviations shown in Appendix II and any other abbreviations which the Secretary may from time to time authorise should be used
- 30 When Regalication is unnecessary—Gonerally, every paper received in some register but in certain cases registration may 1 c dispensed with under the general orders of the Secretary,  $e\,g$ , acknowledgments of papers received summonses returned and petitions which are not properly stamped and are returned accordingly.
- 31 Regis er of Miscellaneous Correspondence—A register of miscel laneous correspondence in Form A appended may be kept for unimport and communications such as petitions which are either field or disposed of by a communication to which no reply is expected, and which do not relate to an existing file. All such papers may be kept in one or more 'Miscellaneous' files. Care must however, be taken to see that papers which relate to an existing file or regarding which the opening of a new file is or may become devirable are not treated as miscellaneous. Papers entered in this register will not be indexed in the absence of a special order to that effect
- If a reference is ordered to which a reply is expected, an ordinary file should be opened at once and the correspondence should then be registered in the register of files
- 32 Register of Files—All ordinary correspondence not entered in any other register should be registered in a register of files in Form B appended. The register should be paged and one page should ordinarily be allowed for each file. It this is exceeded registration should be continued on the next blank page, forward and backward references being given

- 33 Periodical Returns—A list of periodical returns due to or from the office should be prepared and each return should be given a number. A copy of the list should be hung up in every brunch concerned. A permanent file should be opened for each return and it will bear the number of the return and the letter R to show that it is a permanent file relating to a periodical return, the brunch litterms; also be added e.g., "27 P.R." In all correspondence relating to the return, this number should be used as the file number—no year need be added. Periodical returns, on receipt or despatch, should be registered in a register in Form C appended. This register may be lept in the branch concerned.
- 34. Opening new registers—New registers will be opened for each beneath at the beginning of each ealendar year, but papers should ordinarily continue to be registered in the register of the year in which the file wa opened even after the expiry of that year. It may however, be desirable sometimes to carry forward registration to the register of the current year of which is the beneath of the property of the property of the property of the property of the year. When a file becomes bull vand a fresh volume is started. In such case a note should be made in the old register showing where the registration is continued, \*92. \*continued at page 95 of 1924 register.\*
- 35 Central Record Room —If a single record room is kept for all o several branches, a separate register of files should be kept for each branch.

#### VIII -INDEXING

- 36 Object —An index of records and rending files must be kept. The main object of the index is to enable all the previous papers in the record or elsewhere in the office relating to a specified subject or person to b traced and submitted as quickly as possible. The index should be so devise that no previous papers relating to the matter in hand are accidentally over looked.
- 37. Card or loose-leaf Index.—The index should be in the form of card index or loose leaf index. It will be assumed in the followin description that card index is used but the procedure is similar if a loose leading index is used, as may be found convenient in certain cases.
- 38 Major and Minor Heads—Great importance attaches to the selection of proper subject headings. The index showing major and minor heads for use in the Rajputana Agency as approved by the Secretary is printe separately, and no addition may be made to the list without the Secretary sanction.

list. It is

#### General sh

respect of matters on which there may be correspondence with the Agent t the Governor General, this will facilitate the indexing of papers in the offic of the receipt

39 Cross References—Every file must be ordinanly indexed unde approved major and minor heads as soon as it is opened, but cross reference under other leads may be made at the discretion of the record keeper or heaciets. Sub heads must be used to keep the subject of each file as defiint as possible (see pringraph 49)

- 40 Cards.—Major heads must be written or type-written in likely out til kiters at the top of a card the rainor head on the next his and the sub haid on the following lines. The file number (including the branch kiter and very) should be entered on the fight of or below the sub head When the crid's intended to make a crios reference to another head the head from which the cross reference is to be made will be entered in block or capital kiters at the top of the card and the major minor and sub haids of which this reference is to be made will be entered on the next three lines with the word—so before the major head, in this cale no file number need be entered. In an index of names, the name should be written or type written in block or capital letters on the first line further particulars, such as designation father's name or addition, should be given in the second and following lines to enable the person named to be distinguished from others bearing the same name.
  - 41 Branch Index.—In a small office or branch where the record keeper's index is radily available for the use of the clerks, a single index will generally suffice in a large office with sentral record room not inadily-accessible to all the clerks a duplicate index should be kept in each branch of the files relating to it. In the circle it is assumed that a duplicate index is kept, where this is not done in fire new to the duplicate index should be disregarded.
  - 4.2 Pending Cases.—In both indexes, the eards relating to pending cases should be kept in a separate portion of the index from those relating to closed files. The branch of it will be able to disternine from the card index whether it is necessary to open a firsh file or not on the receipt of a communication in which there is no quotation of a pending file number. When a file is disposed of, the index card or cards in lating to it should be transferred to the portion of the index which is lates to of ed files.
  - 43 Subsidiary Indices.—The index may be divided into portions by means of made evide. Besides the general index (1) of closed this and (2) of priding file it i i as be found convenient to have an index of names separate indices for each state are not necessary. If a name-index is kept names may be excluded from the main or subject index, if a subject index is kept for a state, additional cards will have to be made for the State subject index as the subject may made be included in the main subject index.
  - 44 Where Indexing is unnecessary.—In certain cases it will not be necessary to in lex records at all -cc, the records of judicial cases which should be kept in the record from in senal order of numbers of cases for each class of case. It must not be worth while to make an in lex of applications for per unsum let the time 4 til, the applications and connected papers should be kept in the record from in senal order of numbers in the requirer of such applications, and cannot be supported at the record rounds of a final fex is necessary it should be an index of names. It is not necessary to order periodically, a file for each periodical should be kept and these files should be arranged in the record from in a special place according to the numbers of the periodicals.

The Secretary will issue general orders as to the classes of cases which need not be indexed.

#### IX -Arrangement of a Case

- 45 Single Case —A case for orders will be submitted in a file board. The papers should be arranged in the following order beginning from the bottom
  - 1 Files put up for reference in order of number and year—the oldest files being in the bottom
    - 2 The file of the case
    - 3 Draft if any
    - 4 Paper under consideration
      - 5 Notes
  - 6 Outside the flaps under the tape any books plans etc put up for reference
- The papers in the file should be arranged in chronological order so as to read forward like a book. The P UC should be reparate from the nie but as soon as the draft has issued or other action been taken the paper under consideration and the draft if any should be placed in the file in chronological order.
- 46 Binding of It'es Care should be exercised in binding papers into a file that the whole of the paper is easily legible without undoing the file lace. In the case of half margin drafts or office copies which are duly licates of
  - 47 Lirling Cases Cases can be lirked when it is desired to refer in connection with one case for orders to files which are already included in another case which has not been disposed of so as to avoid breaking up either case or when two cognate cases are put up together for orders

#### λ —ΓιΡST ACTION IN THE B™INCH

48 New Subjects — If a receipt does not obviously relate to a pending case the branch clark should ascertain by reference to the index of penuing cross trucked

ether the the head c'erk to

enter the receipt in the Register of Miscellaneous Correspondence (see para graph 31)

49 Great care should be taken to keep the subject of each file as definite as so sold , any tendency to place on one file a large number of receipts dealing with different aspects of a general subject should be checked as this will make the file unwelldy and impede business it is better to have a larger number of files cach with a more limited subject, new files should be freely opened when desirable Appendix III contains some general instructions regarding the op in ing of files
MAGGE

- 50 If the head clerk decides that a new file should be opened or orders to that effect are received in the Register of Miscellaneous Correspondence he will enter at the head of the receipt in red ink the major minor and sub heads under which, it is to be indexed and underline, in the minor and sub heads any heads under which, in his opinion it should be cross-referenced in the index, he must not use any unauthorised major or minor head without the permission of the Secretary which should be obtained, if necessary through the record keeper and Registers
- 51 The branch clerk will prepare index cards and a file cover (in Government of India Stundard Form S 97) accordingly and attach the receipt to the file cover by a tag through the left hand to; coincer and after consulting the index will note on the file cover any previous files which he requires he will tale or send them all in a file board to the record I ceper. The latter will register the receipt and enter the file number on the file cover on the index cards (other than those for cross references) and at the top of the receipt, he will place his index cards in their places in his index put up the previous files asked for or a slip showing in what pending cases they are to be found or stating that they

the branch clerk and initialled by them respectively whenever the pending file is transferred from one to the other

52 Penling Subject—(n) When a receipt relates to a pending case and pending cases and lept in the branch the head clock will before giving the receipt to the branch of it obtain the case and register the receipt by entering

January 1921' an abstract of the receipt should be entered in the notes

(b) If the reg ster of files is lept in the branch and not by the record keeper the Head Clerk will register the new receipt in it or have it registered under his direct personal supervision before giving the receipt to the branch clirk,

(c) In other cases the new receipt should be sent or taken at once by the branch clirk to the record keeper, who will regarter it in the register of files, the record legar will return the receipt to the branch clerk, he will at the same time g; c the larach cleft the pending case of he has it, taking the latter's mutual in the slif for the case

The branch clerl will add the receipt to the file and number its pages in continuation of the last page number in the file. A cross reference should be added at any time before a file is closed if a receipt renders it distrible

If the receipt completes the replies due to a reference, the branch clerk will see out the file number in his reminder diary against the, date on which the per terminder was to have been issued—this date is given on the margin of the draft of the reference (cf. paragraph 116)

53 Letters from Princes - When a letter is received from a Ruling

amme the question raised and to send a further reply

51 Printed comes of letters received—Whin a printed copy is received of a communication previously received in minuscript the printed copy should be substituted for the manuscript copy which should be distroyed.

#### MI-REFERENCING

- 55 "Referencing" defined —The object of referencing is to enable papers referred to or likely to be referred to by persons dealing with a case to be easily consulted, it includes the following processes
  - (a) Putting up any previous correspondence likely to assist in the disposal of the paper under consideration
  - (b) Noting in the margin of the paper under consideration and of the notes where any previous paper referred to in them can be found.
  - (c) "Flagging" a paper to which reference has been made in the paper
     under consideration or in the notes or is likely to be made in the notes

In a marginal note made under clause (b) above the file number and page of the file as well as the flag attached to it, should be quoted (g = 65A/23 page 12 fl L.) unless the information is already given in the letter press

56 New File.—When a new file is opened, the branch clerk will as already described obtain from the record keeper any previous files in the recordroom which appear likely to assist in the disposal of the paper under consideration if any file likely to be winted is put up with another pending case the branch clerk should obtain that case and link it tumporarily with the case under consideration.

The branch clerk will examine the files put up and remove any which are not wanted, obtaining if necessary, the verbal orders of the head clerk before doing so, any files so removed should be returned at once to the record keeper. The branch clerk, as he goes through the files should flig any paper referred to in the P. U. C., or to which he thinks it h'ely that a reference will be made.

57 Additions to File—Every paper added to the file at any stage must be at once 'referenced' by the branch clerk, such papers include notes, drafts and further correspondence

### XII -Notes

58 Object —The object of the notes written by the clerks is to make it caver for the officers dealing with the cave to arrive at correct decisions on the questions raised in the corr spondence. No note should be submitted which does not have this effect or which is not hillely to be read by the officer cone mid.

50 Contents.—The notes will vary in different cases; in a simple case no note at all may be required. In a complicated case the note may contain all or any of the following —

- (a) a preus of previous history or correspondence;
- (b) a verification of facts all god in the P. U. C.;
- (c) the points for decision,
  - (d) a verification of the correctness of ref reness to Arts, rules, previous correspond nee, etc., in the P. U. C. and of their interpretation as bearing on the points for decision;
  - (c) further references to Acts, rules, previous correspondence, etc., bearing on the points for dec. on; and
- (f) precedents.
- The occasions however on a lack a full note of this description will be required will be rare. Note thould also be subject as possible.
  - 60 Incorrect Robes... The fitti ming of outfluence occur in notes :--
    - (a) long -(i) (i) articulations the pressons correspondence or from

- (d) Notes by (1) the branch clerk, (2) the head clerk, (3) the Secretary and (4) the Agent to the Governor General,
- (e) Branch and head clerk's note, " Draft submitted ",
- (f) To whom a reference is made and date (red ink) eg, "To-P O, M W R, 18th December 1923",
- (g) From whom a reply is received and date (red ink) eg, "From—PO, MWR, No 75/23, 18th December 1923",
- (h) Further notes by the branch clerk, etc
- 64 Marginal Notes—Marginal notes should not be written by any onbe'ow the rank of Registrar except in brief reply to a question, in other case the passage should be marked in the margin by a line and letter and the eleri should deal in a further note below the last notes with "the point at (letter) in the Secretary's note dated."
- 65 Notes to be imitalled —Every note must be initialled and dated by the writer. The date must include the year. Initials below the previous note without comment indicate acceptance of the correctness of the previous note and approval of any suggestions for action. made in them
- 66 Branch Clerk's notes —The branch clerk should note only in accord ance with the general or special instructions (to be obtained verbally) of th head clerk — He should not attempt to suggest the disposal of a case, unless it i of a routine nature and in accordance with well established precedent
- 67 Head Clerk's note —The head clerk should delete from the brane clerk's note anything that is wrong or unnecessary and should correct it and hav it copied as corrected, if necessary He may of course supplement it by a fin ther note but should be careful not to repeat what is in the branch clerk's note. The head clerk should not discuss questions of policy or administration or suggest how cases of complexity or importance should be disposed of, in ordinar

#### which he considers unnecessary

- 68 Further duties of Branch Clerk —The branch clerk must at ever stage see that every note is 'referenced' and that the rotes are par graphed, this must be done for example, before the head clerk's note is sul mitted to the Secretary and before the Secretary's note is submitted to the Agent to the Governor General 'Before a case is submitted to the Agent to the Governor General or Secretary, the branch clerk will see that there are one e two blank sheets of paper at the end of the notes for the use of the office concerned
- 69 If in doubt, head clerk or branch clerks, with the permission of the head clerk, should consult the Secretary before noting

- 78 The letter form should be used in addressing Durburs and when the subject matter cannot concemently be expressed in memorandum form, e.g., when an argument has to be developed at some length
- 79 The memorandum form is designed to secure economy and expedition communications in this form should be in brief telegraphic form. It is suitable for stringbiforward statements of facts or orders
- 80 Endorsements—The endorsement form should be used when transmitting copies for information or with bird instructions but it should not ordiferable be employed in addressing unofficial persons other than petitioners sample endorsements and memorands on petitions will be found in Appendix IV Routine memorands and endorsements to Political Officers, etc. may resumder the attestation of Registrar after they have been passed by Secretary
- 81 Telegrams —Telegrams should be used as springly is possible. It should always le considered what saving in time will be effected by sen ling a telegram instead of a letter a telegram received after office hours has generally. The worthing of telegram is the saving of the saving

the meaning is clear linary' telegram will

suffice

- 89 When the purport of a general communication has to be sent to Political Officers for the information of Darbara it should where possible be drifted in the form of a note, and despatched with a covering letter. Sufficient copies of the 1 ote should be sent to each Political Officer for the information of each Darbara.
- 83 Demi-official Letters—Demi official correspondence may be used, where uccessary, to supplement or extlant official correspondence or to take the place of official correspondence in cases of extreme secrecy or great urgency.

Demi official letters should be included in the file in their places in chronological order. A demi official letter received should if necessary, be pasted on to a foolscap sheet. Demi official correspondence abould not be referred to in official correspondence.

84 Unofficial References -An unofficial reference consists in marking

in respect to which the reference is made should be stated as I recisely as possible. An unofficial reference must not be made without the permission of an officer not below the rank of Registrar

85 Preparation of the Draft—(a) In simple cases or where there is established precedent or there is little doubt as to the message to be sent, a draft and fair copy for signature should be submitted with the case in the first instance, this practice should be adopted as much as possible, what is in the draft need not be repeated in the note which may generally be very burft, eg, "Draft submitted, for precedent see No 21/22, page 6", this practice saves

trouble and delay in disposal as the officer to whom the case is submitted can at once deal with the draft and if he approves of it with little or no alteration sign the fair copy and will be saved the re-examination of the case, which is necessary when a draft is submitted after orders have been passed on the notes.

- (b) In other instances the case may be returned by the Agent to the Governor General or Secretary with a druft (or with a fur copy already signed and a copy mutualled for the file) in such cases the head clerk must examine the draft or communication and if he considers that any portion of it is based on a misapprehension or that any point for decision has been overlooked or that a draft passed by the Secretary should under the general instructions of the Agent to the Governor General have been submitted to the latter it is the head clerk's duty to bring the matter to the notice of the Secretary at once either personally or by a separate note placed at the top of the case
- (c) When the orders presed on the notes necessitate the preparation of a draft in the office the lead clerk will decide whether he will a repare or dictate the whole draft himself or entrust the preparation of the whole or a portion of it to the branch clerk his decision should dej end on the complexity of the case and on the abilities and experience of the branch clerk but he should trun the branch clerk in preparing drafts

If there are any doubtful points in the orders on the notes, the Secretary's instructions should be obtained at once verbally if possible

- 86 Form of Draft -A draft of an official reference should ordinarily be written half margin on a separate fool-cap sheet. When a fair copy is submitted with a drift under paragraph So (a) and the draft is made by carlon paper at the same time as the fair copy, the draft need not be half margin
- 87 At the head of every draft of an official letter memorandum or en dorsement should be put the numl er to be placed at the head of the fair copy, In the case of a telegram this number should be placed at tle beginning of the message
- 88 At the beginning of every letter or memorandum to an official should be placed first the subject as entered in the file regulter and then the number and date of any communication to which it is a reply, e.g.,

Sır,

#### Allowance—Grain Compensation Menials

Your letter 773 C /23 dated the 25th September 1923'

This form facilitates the distribution of the Dak in the office of receipt

80 Enclosures - When enclosures have to accompany a communica

tion the drafter should enter

re is a long list of enclosures inclu the

margin of the draft in red ink or red pencil against the entry showing the list of enclosures as a guide to the copying and comparing clerks and to the despatcher

00 Copies of Enclosures -When it is intended that a Political Office should communicate a copy or copies of a communication or of its enclosure

- to Darbars or other authorities, a sufficient number of copies of the communication or enclosures should be sent with the communication to save the trouble of having fresh copies made in the Political Officer's office. In such cases the branch clerk must note the number of copies of the enclosure to be sent at the end of the draft for the instruction of the copying and comparing clerks and of the desnatcher.
- 91 Addresses—A list of persons to whom the communication is to be sent must be placed at the head of the draft Authorised abbreviations should be used (Appendix II)
- 92 First Reminder—At the end of the draft in the margin above the list of addressees, if a reply is necessary to the communication the drafter should enter the date on which he thinks that the first reminder should issue, if a reply is not received by that date, eg, "1st Rem 2nd February 1921."
- 93 Reference in Reply—When a reply is sent to a communication regarding which one or more reminders have issued the reply should quote the date of the original communication and not that of the reminder, e.g., "with reference to your letter No 71 P \$23, dated the 17th March 1923 and subsequent reminders"
- 94 Place in Case—A draft when ready should be put in its proper place in the case and the whole case should be submitted to the Secretary for the place the hand of a case. Boweters and the submitted to the Secretary for

the Governor General or not

#### XV -FAIR COPYING

- 95 Definition —A "fair copy" means a copy of a communication to be sent out of the office
- 96 When Fair Copy to be made in Branch—When no draft is necessary, or when the fair copy is submitted with the draft the fair copy will be prepared by the branch clerk and submitted by the head clerk direct for signature.
- 97 When draft sent to Copying Branch -In other cases, after a draft has been passed, the branch clerk will-
  - (a) if a reply is expected, note the file number in his reminder diary against the date on which the first reminder is to be issued, and
  - (b) remove the draft from the case and send it to the copying branch
- If he desires to have a clean copy for the file in place of the draft as presed he must give instructions accordingly. He should ordinantly obtain a clean copy if the draft is in manuscript

If copies of papers in the case are to be enclosed, the case or file concerned should be sent to the copying branch with necessary instructions

98 Date—The copying clerk will enter the date above the draft and below the File No, this will be the date of the communication and will be entered as such in the fair copy MAGGE

- 99 Number The number at the head of the draft should be entered the head of the communication, eg, "No 65 A/23"
- 100 Comparing—After the copies have been made, they should be impared by the head clerk or a branch clerk. The clerks copying or comaring fair copies should initial all the fair copies (including any to be kept a the file) in token of their having done so testers should be checked by the Scoretary
- 101 Signature—The comparing clork will send the fair copies for signature in a portfolio. Any fair drafts should be submitted for initials at the same time as the fair copy. Letters to be sent to the Government of India, a local Government or the General Officer Commanding a Division should ordinarily be submitted to the Agent to the Governor General for signature. The Secretary will issue such instructions as may be necessary as to the

a fair draft has been initialled by the officer signing the fair copy, the original rough draft may be destroyed at once by the comparing clerk.

#### XVI -- DESPATCH

- 102 Papers to be sent to Despatcher—All communications to be despatched from the office should be sent to the despatcher. When a fair copy is signed by the Registrar or any subordinate officer, it will be sent direct, after signature by him to the despatcher with any papers put up with the fair copy. A fair copy signed by a higher officer will be returned to the clerk who submitted it, this clerk will at once send to the despatcher the fair copy with the draft if there is one or with a register or note in which the despatch can be noted. In the case of papers registered in the Register of Miscellane ous Correspondence the register should be sent with a note in the last column as indicated in paragraph 76
- 103 Return of Office Comes, etc.—The despatcher, after ventying the correctness of the papers (including any enclosures to be sent) will mark at the end of the draft or in the register or note by means of a rubber stamp, the word 'Despatched' and the date he will then return to the branch concerned all the papers except the fur copies to be despatched papers relating to files of which the record keeper keeps the registers in Form B should be sent through him so that he may entire the stance when the papers were the transact when the great was the sent through him so that he may entire the stance when the great was the sent through him so that he may entire the stance when the great was the sent through him so that he may entire the stance when the great was the sent through him so that he may entire the stance when the great her sent the stance when the sent through the so that he may entire the stance when the sent through the
- 101 Telegrams, etc —The despatcher will be responsible for the prompt despatch of telegrams and of papers marked "urgent" for local delivery
- 105 Hours of closing Dak to be fixed—The Registrar will fix hours at which messengers should ordinarily be sent out for local delivery, every messenger must have a book in which the despatcher will enter the name of every addressee and the number of packets sent to each, on the messenger's return the despatcher must at once examine the book to see that all covers sent out have been correctly delivered and duly acknowledged
- 106 The Pegistrar will fix hours at which the despatcher will close packets for delivery by 10th in different directions. Different hours may be fixed for registered and other letters

107 The hours fixed under the preceding paragraphs should be included in a notice to be hung up in every branch

108. Accumulation of Papers —Papers received during the day for despatch will be placed by the despatcher in appropriate pigeon holes pending the closing of the dak, unless they are addressed to petitioners, when they may be put in covers, addressed and stamped at once

- 109 Closing Dak —At the time fixed for closing the dak the despatcher will place all the papers for the same person in one cover unless they are too bulky
- 110 Economy Labels Economy labels should be used for ordinary non confidential communications to officials
- 111 Registered Post—If papers are to be sent by registered post the clerk will personally take them to the despatcher and give him necessary instructions, the despatcher will enter in manuscript after the entry "Dispatched" the word "Registered" (and "Ack Due" if an acknowledgment it to be obtained) and initial this entry. The despatcher will keep the postal receipts for registered letters in chronological order-for ex months and then destroy them.
- 112. Stamps.—When all the covers are ready for the post, the despatches will mark the date of despatch on each cover with his rubber stamp just below sary entries in his Stamp Register (Form and the Register to the Superintendent.

correct, he should check any wastage of stamps or the employment of unnecessarily large covers. The Superintendent should also see that the value of stamps issued to the despatcher is entered in the latter's Stamp Register.

113 The stock of service stamps should be kept under lock and key under the charge of the Accounts Clerk, who should maintain an account showing all receipts of stamps from the Treasury and disburements made to the despatch clerk. The despatch clerk should also keep the stamps under lock and key and issue them in small quantities to the Daftri, who should

ciera should be made primarily responsible for this check. The Accounts Clera should exercise supervision and check the issues and balance on hand at least once a month at irregular intervals

- 114 Further Action by Branch Clerk -On receipt of the draft, etc., from the despatcher, the branch clerk will-
  - (a) add the draft to the file;
  - (b) page it in continuation;
    - (c) note its despatch in the notes in red ink, see paragraph 63 (f);
    - (d) if the register of files is maintained in the branch in Form B appended, register the issue or have it registered;

(c) take or send the case to the record keeper, if he keeps pending cases, or otherwise put it in its place in the scripl order of file numbers among the pending cases of the branch

#### AMI -REMINDERS

115 Dirry.—Frery branch clerk will keep a diarr, this will consist of the fool cap sleets stitched lengthwise in the middle so as to form 12 page, each page leine half a fool cap sheet, one page will be allotted for each month of the vert. The pages should be ruled so as to give one line for every day of the month. The object of this diary is to ensure and facilitate the issue of reminders.

As directed in paragraph 97 (a) the branch clerk will note in the reminderdragate the file number against the date on which the first reminder is to be is used. If all replies are received before that date the branch clerk may score out the entry of the file number in the reminder diary against the date relating to the reminder.

116 Issue of Feminders — I very morning the branch clirk will ascertum from his runnder diary on what files he should issue reminders on that date he will at once obtain the cases minimed. If the date on which a reminder should be issued according to diary is a Sunday or public holiday, the reminder may be issued on the next working day. Except where the reply is due from the Government of India, the branch clerk will prepare necessary reminders for signature (no office copy should be kept) and at the same time note in the margin of the draft under the entire relating to the reminder issuing the date on which the next reminder should, in his opinion, issue cg. 2nd Rem. 2nd March 1924. The case should then be submitted through the head clerk to the Registers with the reminder or reminders on top and immediately below them the page of the draft on which the dates of the reminders are entered

117 Sirindure and Despatch—The Registrir, after signing the reminders and initialling against the entry relating to the reminders issued in token of his signature and of his approval of the date on which the next reminder is to be sent will-send the case to the despatcher who will take out the reminders for despatch and mink the date of despatch with his rull for stamp against the entry relating to the reminder on that draft. The despatcher will then return the case to the branch concerned.

11° Subsequent Reminders —The Tranch clerk will note in his reminder-that the file number result the date on which the next reminder is to be round, le will then return the creation before und, le will then return the

The sun procedure theuld be followed with reference to subsequent

110 Reminders to Government of India.—It is unusual to send efficied from ders to the Covernment of India in the als nee of special reason for so did agastich builthe explain almost case. If a right is a trecived from the Court it of the latest the distribution in the distribution of the latest the first resummers shall easied the contribution of the latest the

- 120. Eurther Uses of Diary.—The reminder dary may be used for noting other files on which action is to be taken on a particular date, eg, if special report has to be submitted on a particular date the connected file should be noted against a date sufficiently early to enable the report to be prepared in time
- 121 Perodical Returns—The duary may also be used for noting dates on which action should be taken in connection with periodical returns,  $eg_1$ , by the issue of advance reminders or reminders or by the compilation of information in the office, only the number of the periodical need be entered against the date on which action is to be taken,  $eg_1 \, (^{\circ}27 \, \mathrm{PA}^{\circ})$ .

#### XVIII -CLOSING FILES

- 122 When File should be closed—A file should be closed as soon as the question raised when the file was opened is decided. This will generally occur when a reply has been received to a reference which has been issued or a final reply is issued from the office.
- 123 Orders to close—If the branch clerk thinks that the file should be closed, he will enter the word 'Record' on the last page of the file below the last communication or draft and will submit the file to the head clerk If the head clerk agrees that the file should be closed, he will imital the word 'Record'
- 124 Procedure in closing —The branch clerk will then take the following measures to close the file
  - (a) He will remove and place together all rough drafts, drafts not approved, duplicate copies, routine slips reminders, replies to reminders etc, which should timediately be destroyed he should also remove for future use any blank sheets attached to the notes which have not been used.
  - (b) If he keeps a card index of files, he will transfer the cards relating to the file (including cross references) to the portion of the index relating to closed files.
  - (c) He will, if necessary, divide the file into parts if one portion of the file should under the rules relating to destruction of records, be kept longer than the other portion (see Appendix V)
  - (d) He will note on the file-cover (Government of India Standard Form S 97) the dates on which the file or each part of it should be destroyed (Appendix V)
  - (e) He will arrange each part, the notes first and the correspondence second, the notes should either be bound in with the correspendence or, if bulky, bound in a separate file cover marked with the file number, the word "notes" being added. They should not be kept loose
  - (f) He will then obtain the approval of the head clerk who will signify it by initialling on the cover below the entry regarding destruction

- (g) The head clerk will then consider whether the file should be indexed under any other heads than that on the file cover and if so direct the brandhelerk to prepare the necessary cands.
- (h) The branch clirk will take or send the whole case to the record keeper, with any new cards for the record-keeper's index
- (i) He should obtain from the record-keeper the slips for the case and for previous files now returned by him.

125. The record keeper will proceed as directed in paragraph 131.

#### XIX -RECOFD-REFER

126 Responsibilities.—The record keeper is responsible for the maintenance of the receiver of files for his in icx of files for the safe custody, preservation and dusting of records and for their destination in accordance with railes on the subject he must also comple with requisitions for records with promptitude. No unauthorised person should be allowed access to the records.

127 Pending Cases.—Unless a certral system of records is in force, the record keeper may also take charge of pending cases, he should keep these unbroken apart from the ordinary records.

12. Closed Files.—Records of closed files must be kept in serial order in bin iles of come ement size each bundle being between boards of wood or still civil boards bound by two types, on the top board of each bundle should be noted the numbers of the files which are to be included within it, e.g.,—

" Branch B 1923.

Nos. 101 to 700".

The lundles roust be arranged on shelves and sho 11 be piled so that the space between two shelves is nearly filed. On the or sade of each shell below each pale of bundle should be entered the year and the numbers of the files on that portion of shell, an "foll 1000 B 1002".

12) Files taken out.—When any fle is taken out for reference from the records, a slip showing the file in connection with which it is required and initiall day the branch clock, must be put in its place. This slip shoull be retired to the branch clock in trave be destroyed by him when the file is put back in its place. The record keeper will also not on the cover of the file the ties which are put up for reference in connection with it.

130 Opening a file—When a file is to be opened, the record Leeper will recover the paper in a file board from the branch click, with the index earls; the record Leeper will recite the file in the register of files and enter the file rumber on the paper under consideration and on the cards on which the new file is in level. He will then put in the case are previous files in the records for which the litanch click list saked on, if these are not in the records, put in a slip showing in what peoling cases they are to be found if they have not been decreased it will the return the case to the litanch click with the little sin file card and the necessary slips for files issued to be initialled and returned by the latter, these slips should include a slip relating to the pending file and headed pending file in the should be exchanged between the record Leeper and

the branch clerk and initialled by them respectively whenever a pending file

changes hands

131 Closing a File - When a file is closed the record keeper on receipt of the case will verify that the file is in order and will return to the branch clerk the slips for the file and for any previous files put up in the case the previous files should be at once returned to their proper places in the records the record keeper will have the newly closed file stitched and paged and will note the number of p ges in each part on the file cover he will note in the register of files the date of closing the form of disposal and the date of destruction of each He will also enter the date of destruction in his destruction register (paragraph 133) He will at the same time put a circle round the number m to indicate that the file is closed the first cloumn of the register eg The index cards relating to the file should be transferred from the portion of the index relating to pending cares to that relating to closed files the file should be put in its place in the records

132 Reopening closed File prohibited -A file once closed must not be re opened without the permission of the Secretary but such papers as acknowledgment of receipt of communications which do not involve further correspondence may be added to file after it is closed

133 Destruction of Records -The record keeper is responsible for the destruction of records when it is due. For this purpose he will maintain a destruction reg ster showing under the appropriate month and year the files

Sceretary with the lit for orders as to their destruction. If in any case the Secr tary considers that a file should be retained for a longer period the de struction register the register of files and the entries on the files must be altered When a file has been destroyed the destroying officer will ente the date of destruction in column of the register and will all o put a cross ove the file number in the first column eq The record keeper will not in his card index the fact that file has been destroyed by noting by the rubbe stamp Dest (date) on the card if all the files on the card have been destroyed it ma ha +h a card index relati

index is kept in

cords to the branch cierk so that similar action may be taken there

The record keeper will also carry out similarly the destruction of periodica returns judicial case records and other papers which are ripe for destruction but are not kept in ordinary files

The destruction of records for the year should ordinarily be completed a the first quarter of the year. A report must be submitted by the record keeps through the Registrar to the Secretary at the beginning of April.

AA -DUTIES OF CONFIDENTIAL CLEPK.

131 The Confidential Clerk will be the only person in the office under th Secretary to deal with confidential and secret papers He will maintain regu ters of such papers in forms 1 and B and a reminder-diary and will Leep in

own custody all confidential and secret records and an index of them When however, such a course appears desirable and unobjectionable he may send it the record keeper an index card relating to a confidential paper so that, if the matter is referred to in ordinary correspondence, the confidential file may no be overlooked. The Confidential Clerk will also be responsible for the destruction confidential and secret records under the orders of the Secretary. He may also obtain the Secretary's orders to transfer confidential papers to the generaccords when there is no longer any adequate reason for keeping them confidential, such records should be acknowledged by the record keeper an should be kept in serial order in special place in the record room and should be the series of th

135 The Confidential Clerk will copy and despatch all confidential are secret papers to be sent out of the office, such papers should be put into double scaled covers the inner cover only should be marked 'confidential' or 'secret and superscribed with only the name of the addressee, the outer cover should bear his usual official address

#### XXI -- MISCELLANEOUS

136 Check on disposal of business—All branch clerks will submione a week a list of cases which have been pending with them for more that six days. This list will be submitted through the head clerk and the Registra to the Secretary.

197 m 1 ' '

that it is I disposal of

darpoint of purpose, the record keeper may chp together, by means of a paper fastener in one corner, the pages of the register on which there are no file pending

138 The Registers should examine all the registers in the office for the current year at the beginning of each month and submit them to the Secretar with his remarks when the latter is at Headquartors. These registers should be returned as soon as possible to the record keeper concerned, any note from the Secretary asking for any pending files being attended to senarately

- 139 Interviews—If there are any papers regarding a person to whot the Agent to the Governor General grants an interview, they should be sufmitted to him on the day before the interview is to take place.
- 140 Corrections —When slips are pasted in files books or registers t cover untidy or cancelled writing they should be initialled by the clerk doin it and by the bead clerk
  - 141 Signature and initials to be dated.—All signatures and initial should be dated , date includes the year
- 142 Stationery—Stationery will be supplied at the beginning of each month to each branch on a receive and a state of the s

Stationers or the Secr

responsible

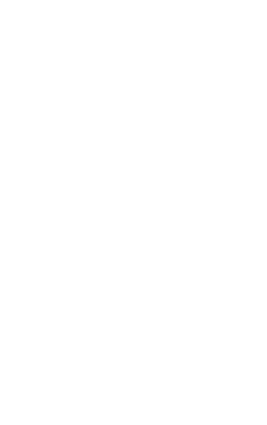

Registrar w refuse to past exercise it in requisitions from head clerks

- 143. Furniture.—The furniture of the Agency Office is in the charge of the Registrar. Proposals for the purchase of new furniture or for renewals of existing stock will be submitted for the orders of the Secretary. A stock book will be maintained by the Registrar in which all new purchases must be entered; no stock should be written off without the Secretary's permission. The Registrar will check the stock in April every year and report the result to the Secretary.
- 144. Tents.—The tents and camp equipage will be in the charge of the Secretary. A stock register will be maintained by the Mir Munshi. The Secretary will inspect the stock once a year.

## or damage.

#### XXII .- TOUR ARRANGEMENTS.

- 145. Modifications in procedure.—The Secretary will decide what modifications in procedure are necessary owing to his absence or to the absence of any clerk, etc., on tour.
- 146. Camp Register.—When the Agent to the Governor-General is absent from Headquarters on tour, a camp register will be opened in which all correspondence received in or issued from camp will be entered. The serial numbers in this register will be independent of numbers in the registers at Headquarters. When a new file is opened in the Gamp, a number from the Gamp Register will be assigned to it, which, with the subject of the file, will be communicated to the Headquarters office. The Headquarters office will then register the file after the last sorial number in the File Register, and communicate it to the Camp Office who will replace it by the number intimated. The Gamp Register will be destroyed on the return of Camp, after comparing the entries with the Headquarters Register. For facility of reference, the number intimated by the Headquarters' office will be noted against the Gamp numbers which have been replaced by them.
- 147. New File.—A memorandum will be sent daily to Headquarters of all receipts in and issues from Camp Office. The details will be entered in the headquarters register and the memorandum will be returned to the Camp Office with the word "entered" and the signature of the person who has made the entry. The letters 'E. H. Q.' ("entered in headquarter register") will be placed against the entries in the Camp register.
- 148. List of Files.—Whenever cases are sent to Headquarters or vice terso, a list showing the file numbers of the cases should be sent at the same time, an office copy made by carbon paper being kept in the office of despatch. The list should be signed on receipt after check by the clerk responsible for opening the Dia and should be returned to the office of despatch. The office copy may then be destroyed.

#### APPENDIX III

# DIRECTIONS REGARDING INDEXING AND OPENING FILES

#### INDEXING [1 the paragraph 49]

The object of indexing is to ensure that papers on any subject are readily available, and that so far as possible all the papers on one subject are indexed in one place.

The index has been drawn up with this object. It will be observed that some heads are placed in square brackets with a cross reference,  $e\,g\,$ ,

[Travelling Allowance see Allowances]

No papers may be indexed under such heads, the object of this prohibition is to him the discretion of the indexer to index some papers under Allowance and some under Traveling

- 2 A file will be indexed under a major head, a minor head if one is given in the index, and a sub head or individual head. New major and minor heads may only be opened with the permission of the Secretary and when this is done all holders of the index must be notified. The choice of sub heads is left to the indexer and new sub-head smut be notified. The choice are necessary "They should, however, hose brief as possible and a new sub-head should not be given when a suitable one already exists. It is possible for more than one file to be indexed under the same sub-head.
- 3 Major heads are as general as possible and when there is an alternative, the most general head should be used in indexing. It will be observed that the following major heads appear in the index.—

Ruling Princes, the names of individual States

Adoption, Jagirdays, Arms and Ammunition, Treaties.

In connection with these heads the following principles should be observed -

- (a) Under Ruling Princes only matters of common interest affecting Ruling Princes generally should be indexed under the various minor heads provided
- (b) Under the names of individual States should be indexed such matters as relate specifically to the State concerned and have no direct connection with other States or States as a whole for national states of States as a whole for national states.

in the

only.

individual states or under Islimrardars, etc. But where an important general principle emerges in a particular case, it should be indicated under the head Adoctor as the transfer of the proof haction

mb head adopt

own no mein

- (c) Where, however, a matter is of more common interest to all States and forman itself o well defined subject, it should be indired under the more general head, e.g., Arms and Ammunition—Armed Police Treaties—Revision Jagur diars—Disputes A cross reference may in such cases be given under the names of the States if thought desirable
- (d) Some cases may appear to fall equally under one or more of such major heads,
  e.g., a d a constant of the c

hare so f-

be ,

- 4. The principle that major heads should be as general as possible is subject to the limitation that if a head is too general it is useless. Thus major heads 'Ajmer Verwara', 'Baputana' are too general to be useful. It is for this reason that an apparent means tency appears under the head Budgets, for while Ajmer Verwara and Hajputana Agency Budgets appear under the head Budgets, other Budgets appear under the mean of the body or department, e.g. Mina Corps, Foresta. Municipal Budgets should aimilarly be indexed under the major head Municipalities and the min r head of the Municipality concerned, e.g. Municipalities. Ajmer Budgets—1923 24.
- 5 Under certain important Major heads a minor head General appears, e.g., Military, Education, Judicial. The object of this minor head is to cover all matters not covered by the remaining minor heads. It is possible that in some cases experience will show that further sub division is necessary.
  - 6 A major head for the title of any Act may be opened without special permission.

7 Separate indices will be maintained for Chief Commissioner's Branch and for the rest of the Agency Office Under each of these divisions, again, there will be a name number as well as a general index.

The name index will often merely refer to files indexed in the

Major X-Motor advance, application for .File-45 A/23

Posted as Political Agent, Southern Rajputana States File 30 P /23

Applications for leave, however, will not be indexed in the general index, but only in the name index.

8 It is not necessary to index cases for which special registers are maintained under the provisions of Rule 26 (a), (c), (d), (e), (f), (g) of the Manual.

#### OPENING FILES

- 1 With a card index system properly maintained there is little fear of relevant papers being overlooked. There is therefore no object in having a large number of papers only posely related to one another on one file and new files should be freely opened.
- 2 As far as possible a file should form a consecutive narrative and the narrative should not be interrupted by the intrusion of extraneous matter
- 4 Separate files should be maintained for individual officers, individual States, etc For instance, deputation of B to State \( \) as Superintendent of Poice should be dealt with on a separate file from that dealing with the deputation of \( A\), by predicessor The connecting link will be the index. Both will appear under I origin Service—X State, and the deputation will also be referred to under the names of the officers in the name index
- 5 Subject to the provisions of the Manual, old files can, where suitable, be re-opened. fo, p. D, Istimardiar of W estate, dies in 1017 and the succession of E is sentcioned. In 1024, E dies and Commissioner recommends the succession of F The 1017 file can conveniently be r. orened
- 6 Great care must, however, be taken in all cases to prevent files becoming bulky and inwiveldy I in a case similar to that mentioned in Rules 3 or 5 there is any likelihood of the correspondence being protracted, a separate file should be opened at once
- 7 Similarly, when any correspondence contains a large number of references and exhibits, it is desirable that exhibits should be kept separate in a file bearing the same number.

but marked Part II It may also be desirable to keep routine papers such as reminders and other unimportant communications, which would ordinarily be destroyed before the file is closed, in a separate temporary file

8 On important subjects a separate file should be maintained for general orders.

Care must be taken
re not lost sight of
principle should be
seary to maintain a

file of general orders, it will be sufficient to indicate such principles by cross references in the index. Suppose, for instance, a file is indexed —

Posting Political Officers-Colonel Spence as Resident, Mewar

In this connection, a question arises regarding the allowances which may be granted for holding a dual charge. This can be indicated by the following cross reference—

Allowances-Charge-Dual charge of Mewar and S R S vide Postings, etc

9 In some cases at may be desirable to maintain several temporary files which can be amalgamated into one before closing, e.g., in the case of tours or ceremonal visit, it is desirable that the papers regarding each visit aboud be kept separate until the visit is over. At the end of the season routine papers should be destroyed and the files weeded Important papers can then either be combined into one file, e.g., at our arrangements, writer 1923 24 or placed on existing files regarding each place visited, if such are main tained, e.g. (Ceremonial—Visite—Japur

10 Before a file is closed, it should be carefully weeded, unimportant papers such as reminders, interim replies, duplicate copies, etc., being destroyed. A note should be made in the notes against each paper that has been destroyed.

RULES FOR THE DESTRUCTION OF RECORDS AND PARIODS FOR WHICH THEY ARE TO BE REPT

### (Paragraph 133)

I The broad principle is that no papers which are likely to be of any value, at any

destroyed. These must constit to not change it is can one case of lights which have to be dealt with. They are merely intended to indicate in a general way he plan on which destruction should be carried out. In all doubtful cases reference to be made to Regulariar and if necessary to the Secretary.

- 2 Classes of papers to be preserved —Documents belonging to any of the descriptions noted below, shall be exempt from destruction, that is to say—
  - (a) Documents relating to the rights of Government, or to matters of political or administrative importance
    - (b) Documents prepared under the provisions of any enactment which appear to contemplate their being preserved
    - (c) Documents the destruction of which would prejudice the rights or affect the habilities of individuals
      - (e) Standing orders of every description
    - (f) Originals of legal documents or documents of legal value
    - (a) Discussions relating to important public services
    - (h) Papers which are important or likely to become important in the future, from a historical, biographical or other important point of view
    - (i) Treatics, agreements and such like documents
    - (3) Original letters on important matters from the Indian Princes and Chiefs
    - (1) Papers containing discussions of important principles or policy.
      (I) Maps sketches and similar papers relating to important or disputed questions.
  - (m) Gazettes of India.

3 Classes of papers to be destroyed - Papers not falling under any of the heads mentioned in the foregoing paragraph

- (a) ~ 1 magnets and others wounded some tall the street and a market in the
  - (!) Periodical I cturns and papers of the kind described in the lasts attached.
  - (c) O<sub>e</sub> ~ Feguiers Requires of letter received and issued should never be destroyed, but bound up for each year and Aprice reparately, the requires of issues and receipts being bound separately. Pepaters, e.g., Staton Dak Rook, Mamp I eguter, Leguter of unofficial cases may be destroyed after three years.
  - (4) Course correspondence—Unless the outpet is of a very thread nature and the Head of the Office is certain that it will notice be referred to again and the space for heaping recent in 1 mited, no letters should be derived but.

, paged and indexed, lowing papers which

Manuscripts of all printed papers except such as are mentioned in paragraph 2

- (e) Printed papers -- More than six spare copies of printed papers
- 4 When the cases have been weeded according to the foregoing instructions, a list of papers intended for destruction will be prepared and submitted to Registrar. He may order the destruction of such cases which can under the rules be destroyed after one, two and three years. The cases of the remaining classes will be put up for the orders of the Secretary.
- 5 When orders have been passed for destruction, Registrar should see that the cases are destroyed and that note to that effect is made by the insertion against the entry of a capital D" in red ink in the File Register As soon as a case is ready for restoration to the record room, as lip indicating the time for which it is intended to be retained according to the classification given to it in the lists should be attached. All doubtful cases will be referred to the Sceretary for orders.
- 6. Printed slips (size 3 inches by 2 inches) coloured red for files to be retained perma nently and blue for files to be kept for a period as noted below will be affixed --

To be retained until

To be retained permanently

months, years.

- 7 The Record keeper will be responsible that no weeded files are received by him in the Record Room unless slips are affixed to them, and he will also maintain a register showing files which are to be destroyed in a particular year
- 8 When there is doubt whether a case should be destroyed or retained, it should be retained
- 9 A list of papers suggested for destruction will be prepared and submitted to the Registrar or the Secretary as the case may be
- 10 Papers which have to be destroyed shall be collected and burnt under proper supervision.
- 11 Important files ordered by the Secretary or the Agent to the Governor General to be printed, should be weeded first and then sent to one of the Government Proses for printing. Proofs should be compared in the branch concerned after which the printed idea will be restored to the Record.

### APPENDIX VI

# Instructions regarding forms (1 ide Appendix I)

FORM A —A separate register should be kept for each branch, the office and branch should be entered on the cover. The date of receipt should be written in red ink across the register above the entries of that date.

FORM B —A separate register should be kept for each branch , the office and branch should be entered on the cover

Column I — Unless columns 4 to 7 are omitted, sufficient space must be left between each entry in column 1 to allow for probable entries in columns 4 to 7, if it is subse quently found that the space allowed is insufficient a fresh entry should be begun later in the book and a reference should be made to it across columns 9 to 12 of the original entry, e.g., "continued after No 453." The original moders should be kept in the new entry, the entres already made in columns 4 to 7 need not be repeated against the new entry.

Column 3 -The 'subject' should be the same as in the index

Columns 4 & 6 - Authorised abbreviations should be used

 ${\it Columns~4~to~7}$  —These columns may be omitted with the sanction of the Secretary provided that

- (a) every receipt after the first is registered in the notes of the file by, or under the direct personal supervision of the record keeper or head clerk, and
- (b) in the case of a file not kept in the office when it is closed the person to whom it is sent and the date of despatch shall be entered across the last two columns of the Remster of Files

Column 9 -These entries are to facilitate destruction

graphs 13/ anu 135 )

R == Retain.

D (Date) = Destroy in the year mentioned

N = Nothing retained in office, i.e., the whole file was finally sent away on the date of closing and is not expected back

If different parts of the file are to be destroyed in different years, this should be stated in column 9,  $\epsilon g$ ,

"I.R. II D (1933)"

would mean that part I is to be retained indefinitely and Part II is to be destroyed in 1933

Column 10 —If the register is maintained by the record keeper column 10 may be comitted

Alternative to Form B — Form B may be divided into two registers in Form B 1 and Form B 2 is Form B 1 to Form B 1 to Form B 1 form B 2 is 
The instructions relating to form B in paragraph 32 will apply to both register-

A receipt beginning a new file would involve entiries in both registers (paragraph 51), subsequent accommendation of the same file would involve entires in both registers (paragraph 51), 62).

(paragraph 51)

FORM C —A separate register should be kept for each branch, the office and branch should be entered on the cover

Column 1—In this column should be entered the number of the permanent file in which the periodical is filed

Columns 4 and 6 — Authorised abbreviations should be used, one line should be allow ed for each individual  $eg_1$  if a return is due from all Political officers, each should be entered on a separate line

Columns 1 to 4, 6, 7 should be filled up at the beginning of the year

FORM D — (Government of India Standard Form S 97) — The letter of the branch should be entered in the bracket after the word "Branch".

The "subject" should be the same as in the index.

## Trade Returns and Commercial History.

CAMPHOR

Camphor obtained from Borneo from the trunk of Dryobalanops aromatics, and by the sublimation from Aled, 223. Dr. accepts this opin the Sankint with modern Campho.

Camphor referred to may ance which at the period India or imported from appear to have been suffit the strongly camphorant the first plant resorted

to as a substitute or adulterant for the prized Camphor of Sumatra. As a matter of fact, this Camphor is much more nearly related to the Malajan than to the China Camphor, and even at the present day it is ten umes the prize of the Formosia Camphor, and is extensively consumed in China, partly as a medicine and partly in perfuming the finer qualities of Chinece ink. Moodeen Sheriff mentions four kinds of Camphor as met with in the basis of South India, vis. (a) Köfüre-qaisüri, (b) Sérati köfür, (c) (Chini-köfür, and (d) Basis-köfür.

# TRADE RETURNS AND COMMPRCIAL HISTORY.

Commerce.—While some of the less important camphors do, to a limited extent, reach Europe and India, the commercial or Chinese form is that which has been called "Common Camphor" This arrives at the English and Indian markets chiefly in a crude state, and is in both countries resub-

TRADE. 263

than the Formosa Camphor.

I chiefly from China, is worth not more than R40 to R65 per cwt. This enormous difference is accounted for by the reputation (searcely mented) which the Bhmasan kind enjoys of peculiar excellence "(Para. 16,

paget 0 and 10)
Of Borneo and Sumatra Camphor probably not more than 2 or 3 cwt. are annually imported into India.

mail ases, view the 22

Indian Refined 264

the process as practised in Bombay. "The process of resublimation is a peculiar one, the object being to get as much interstitual water as possible into the camphor cake. The vessel used is a tinned cylindrical coper drum, one end of which is removable; into this is put 14 parts of crude camphor and 21 parts of water, the cover is then luted with clay, and the drum, being placed upon a small furnace made of clay, 15 also luted to the top of the furnace. In Bornbay four of these furnaces are

C. 264

Penfication of Camphor.

CAMPHOR.

Ind., 1st Ed., 549). This same practice seems to be followed at Delhi and at a few other cures in India, but the method is crude and unrastisfactory, when the purified articles compared with that imported into India from Europe. The Furopean process of rethining camphor was long kept a secret, and towards the end of the seventeenth century, the entire camphor of Europe had to be sent to Holland to be sublimed. A monopoly was also held for some time in Venice, but at the present day camphor-refining is largely accomplished in England, Holland, Hamburg, Par s, New York, and Philadelphia

European Refined, 265

by means of a fire, where flame might ignite the gas given off during the process of sublimation, dishes of faisble metal, kept warm by a furnace below the room, are used. The heat is suddenly raised from 120 to 1905. C, and kept at that point for half an hour, so as to expel the water from the camphor. The temperature is then rused to 204°C, and maintained at that point for 24 hours. When the crude camphor has melted, the sand

The rationals of the process consists in preserving the temperature uniformly at the point of volatilization; the quicklime retains resin or empyreumatic oil, the iron fixes on any sulphur that may be present,

India. In the report of the 12-83 it is mentioned that a ie well. It seems likely that, rupees worth of China Camily, since there is every reason were made, the tree could be

### CAMPHOR.

# Chemical Formula for Camphor.

India is not sufficiently great to tempt experiments being undertaken with Dryobalanops Camphora, but the extended cultivation and manufacture of Blumea and China Camphors would seem highly desirable.

### CAMPROR OIL.

01L 267 Oil of Camphor—There are two very distinct substances known by tamping oil of Borneo. This is obtained by tamping the trees. Some times this accumulates to such an extent that (as with the South American copaiba tree) the trunk, no more able to resist the pressure of the fluid, spontaneously bursts open or has its tissue broken into large internal chambers, producing while this occurs a loud noise, "as if the tree were rent in twain." The Pharmacographia states that Molley, in cutting

distinct and should not be phor-oil of Formosa. This is a brown riquid, nothing in solution an abundance of common camphor,

268

# CHPMICAL AND MEDICAL PROPERTIES OF CAMPHOR

Chemistry—It is not necessary to enter into this subject in great detail For a full account of the chemistry of Camphor the reader is referred to works on chemistry, but more particularly to the Pharmacographia and the United States Dispersatory, as these are more likely to be accessible than the numerous and scattered papers in which this subject has been as a few forms of the papers.

camphar When mixed with resons or concerte only completely lores its odour The formula given for this form of camphor is C<sub>0</sub>H<sub>1</sub>O<sub>0</sub>. There are several forms of this plant met with in India, the seeds and flowers being of different colours (Drury). These according to the Flora of British India, are referred to three distinct varieties—

Var 1st, vrosa, W & A. Prod. 253. Dits & Gibs. Bomb F1, 69, Dolicho vrosas, Rosb, F1 Ind. Ed. CB C., 559 Pods often 24, inches long, 46-seeded Speaking of this form, Roxburgh says '1 do not find that any part of this species is in any shape useful to the natives or others, indeed, the natives of Coromandel, where the plant is common, reckon it posionous, which is corroborated by Van Rheede 'This is known in Bengal as Rathishim, or Kalasshim and Gaissara (Gowara) in Bombay

Var 2nd, turgida, Grah in Wall Gar C Stocksu, Dals & Gibs, Bomb Fl, 69 Pods large and turgid, 3 to 5 inches by 13 to 2 inches Var 3rd, molhs Wall Found in Southern and Western India. The

Var 3rd, molits Wall Found in Southern and Western India The pods are smaller than in either of the above, when cultivated they are tender and eaten like French beans.

Food—The young, tender, half grown pods, apparently of only var 3 are actually eaten, but these constitute the so-called French beans at the tables of Europeans Nituves also eat them in curry. The form with large white seeds is considered the most wholesome. Some five varieties are reported to be cultivated in Lucknow, of which the form known as hitwa, a white narrow-podded variety, so considered the best. Mr Oameron informs the writer that the seeds of this puble are highly relished in Mysor. Alkinaon writes of the North-West Provinces that the zero is "consumed by all classes."

Professor Church gives the analysis of this pulse (p. 144), and adds that its nutrient ratio is 1 22 and the nutrient value 80

importance.

ane-bridges

parallel canes forming the pathway, the canes being knit together with bamboo or bark, so as to constitute a band not more than 18 inches in breadth, through which the rushing water may be seen below. The raking affords additional support, it consists of two canes carried about three or four lett above the pathway, one on either sade. These are here and there connected by perpendicular canes passing under the pathway, and the whole structure is bound together by a network of bark-topes or smaller canes. With the weight of the traveller the bridge bends until its often alarmingly near the water, and to prevent the raking closing on the person crossing the bridge, barriers are thrown across here and there, about 18 inches above the pathway, similar stays are also carried over head. These barriers constitute the chief difficulty in crossing a cane bridge, for on rasing the foot, the swaying structure and the rushing bridge, for on rasing the foot, the swaying structure and the rushing

Bands of stained rattain they use for decorating ear rings, bracelets, and leggings.  Prepared strips of rattain are extensively used in Europea as in India for caning furniture, but a comparatively new and increasing trade in rattain is the construction of baskets, which are rapidly displacing willow baskets; these are used in cotton-mills, sugar refineries, and other factories, as well as employed extensively by Railway Companies and by gardeners, &c. Rattain baskets are peculiarly adapted for carrying carboys containing acids, since the siblac of the cane is not acted on by acids (Spons, Encyclop). The waste product, after stripping the cane, is, by certain manufactures, reduced to a fibre, and in this form is largely used for stuffing mattresses. Cane mattresses are in great favour on the Continent, taking the place of the corr of India.
	TRADE RETURNS OF CANES
	Very little can be learned regarding the internal trade in rattan canes;

but, from the fact of the imports (which come chiefly from the Straits Settlements) into Calcutta, Madras, Burma, and Bombay, far exceeding the exports, it seems that with improved facilities of communication a trade might easily be opened up with Eastern Bengal, Assam, and Burma which would to a large extent check the importation, from foreign countries, of a product of which India has herself an unlimited amount. The following

THE NARCOTIC

the sel beared or 3 -14-

Indua Literature —"The active syronym appears to be bidings, which occurs in the Atharya Veda—the hast of the four sengitures of the Hindus It is derived from a root which means to break, and as supposed to imply the process of debarkation by which the fibres of the plant were separated from the stem. This would indicate that even at the remote period when the Veda in question was written, probably about 3,000 years ago, the use of hemp as a fibre-yielding plant was well known and the knosledge fully utilised. The Veda, however, reckons it, along with the Sond, as one of the five plants "which were liberators of sin," and this would imply that its narrotic properly was also well known. The word is used in the masculine form with a short final voxel, and not, as an later, literature, with a long one. Both the masculine and feminine.

HISTORY OF THE HEMP FIBRE.

The following extract may be here published as giving the most trustworthy facts which can be adduced regarding the history of the fibre "According to Herodotus (born 484 B C), the Scythians used hemp, but in his time the Greeks were scarcely acquainted with it. Hiero II, King of Syracuse, bought the hemp used for the cordage of his vessels in Gaul, and Lucilius is the earliest Roman writer who speaks of the plant (100 BC) Hebrew books do not mention hemp. It was not used in the fabrics which enveloped the mummies of ancient Egypt Even at

CULTIVA-TION. It h

#### CULTIVATION

It has already been incidentally remarked that the cultivation of Cannabis sativa in India is naturally referable to two sections it (a) Coltivation with a view to preparing some of the forms of the narcotic, and (b) cultivation on account of the fibre. It has also been stated that the hemp plant has, to a large extent, changed its character under Indian or rather Assatic cultivation. It is very generally admitted, for example, that in the plans, while the narcotic principle is readily developed, the hemp fibre is but very imperfectly formed. Let it, however, be distinctly understood that by hemp is here exclusively meant the fibre of Cannabis sativa. This remark is all the more necessary when it is added that with Comments of the Tallon 2 N

Indian Methods .- Dr. Royle very appropriately remarks: "There is every reason for believing that the plant is of Eastern origin, while there is no sufficient reason for thinking that the climate of Europe is so pecuharly suited to the production of its fibre as to exclude those of its have resent on a no d to those s here the nint native climes, especially

is grown on account of it

where it is cultivated for latter requires exposure

sowing, while the growth of the fibre is promoted by shade and moisture, which are procured by thick sowing." It has already been pointed out that the regions suited for gante cultivation are perfectly distinct from those where it might be possible to develope an industry in the fibre. However much it may be regretted it seems impossible to combine the two industries, and it is an accepted fact that, unless utilisable as a paper stock, the immense amount of stems annually destroyed by the ganja cultivators must continue to be so, At the same time Mr. Morris, in his account of the Godavery District.

Godavery Hemp. 339

gives some interesting facts regarding the cultivation of hemp fibre. It is planted in November and cut by the end of March. It is grown in drills and never watered. Clay soils and those beyond the reach of inunda-

R100 a putts of land The bundles are buried in mud and left to rot for about a week when they are taken out and beaten in the water, and after all impurities are removed, the fibre is collected." The exports from the district are said to have been, in 1854-55, 4,269 cut

Unless there be some mistake, Sunn hemp having been called "Cannabia sativa," for Mr. Morris gives that scientific name as well as the vernacular name samumu for the fibre he is describing, this information is of the greatest interest, as it would show, what the writer was not aware of until recently, that hemp fibre was actually produced on the plains of India

## Cultivation of Hemp in India

CANNABIS sativa

EARLY EXPERIMENTS IN HEMP CULTIVATION -In 1802 the Govern- CULTIVAment of Ind a made various experiments on an extended scale to estab. For the Fibre lish hemp fibre cultivation Luropean seed was imported, and farms and factories established but finally abandoned Recourse was had to improving the cultivation of the Ind an stock. The cultivation and manufacture was carried on at Rishra, Cassimpore, Maldah, Gorackpore, Mhow Rohilkand, and Azimgarh, under the experienced supervision of European hemp dressers The results were every where unsatisfactory and

THE POSSIBILITE OF MORE PAROUNABLE ICE OF S . SP CO disheartening results, it cannot be definitely stated that it is impossible that hemp fibre can be produced in India The efforts alluded to were mainly

Godavery Hemp. which are procured by thick sowing." It has already been pointed out that the regions saited for ganja cultivation are perfectly distinct from those where it might be possible to develope an industry in the fibre. However much it may be regreited it seems impossible to combine the two industries, and it is an accepted fact that, unless utilisable as a paper stock, the immense amount of stems annually destroyed by the ganja cultivators must continue to be so

At the same time Mr. Morris, in his account of the Godacey Distinct, gives some interesting facts regarding the cultivation of hemp fibre. It is planted in November and cut by the end of March. It is grown in drills and never watered. Clay soils and those beyond the reach of immedation are those best suited. "About 2,200 bindles can be produced in one fulls of land, each bondle yielding it wiss of fibre, or a total of 3,300 vist or 412 maintds, and is valued at one types a maintd. The expenses of cultivation are estimated at R8-8, and those of the preparation of fibre at R100 a patrix of land. The bundles are burned in mid and left to rot for about a week when they are taken out and beaten in the water, and after all impurities are removed, the fibre is collected." The exports from the

district are said to have been, in 1852-85, 4,269 cut.

Unless there he some mist'he, Saun hemp hiving been called.

"Cannabis saura," for Mr. Morris gives that scientific name as well as
the vernacular name saunum for the fibre he is describing, this information
is of the greatest interet, as it would show, hat the writer was not aware
of until recently, that hemp fibre was actually produced on the plains of
India.

CANNABIS sativa.

(Dr G Price Civil Surgeon Shal ibad)

of uncture for c'
the form of ele

MEDICINE Ague Fits Impotence

from a med cal point of view, are the Resin and Volatile Oil

"The former was first obtained in a state of comparative purity by and H Smith in 1846 It is a brown amorphous solid, burning with a bright white flame and leaving no ash It has a very potent action

CHEMICAL COMPOSI-TION

small crystals. With due precautions it may be separated into two bod es the one of which named by Personne Cannabene is I qui d and colourless, with the formula C<sub>11</sub>H<sub>20</sub>, the other which is called Hydrade of Cannabene, is a solid separating from alcohol in platy crystals to which personne assigns formula C<sub>11</sub>H<sub>20</sub>. He asserts that Cinnabene has

annabene 378

from the oil which he obtained from the fresh herb, just after flowering, to the extent of 0.3 per cent

"It remains to be proved whether an alkaloid is present in hemp, as suggested by Preobraschensky

The other constituents of hemp are those commonly occurring in other plants The leaves yield nearly 20 per cent of ash.

As to the resin of Ind an hemp Bolas and Francis, in treating with

from purified resm of charas, but without success" (Fluck and Hanb, Pharmacog page 549)

Dr Dymock (n his 2nd Ed of the Vateria Medica of Western India) goes into considerable deta I on the chemistry of this drug Preobras chensky d scovered in China haschizeth, a volatile alkaloid which he believed to be identical with incoine Dragendroff and Marou sa

published his conviction that hemp contained several alkaloids, the principal one being a substance he named Telano-cannabine. More recently to all these published results of the chemical investigation of the narrotic resin

CANOES.

it is known as Aabar, Arrak) Aabar, Syrian , Aabarish, Turkish 1 - F - F R am I st Comble r - p D f----

Habitat.-This is the plant which affords the Caper berry of Europe It occurs in India in the central and northern parts of the Paniab and in Sind, is less frequent in Raiputana than C. aphylla

Medicine -Dr Stewart remarks that in Langta the roots are said to be applied to soces. The author of the Wakkram-ul-Admiya considers the root bark "to be hot and dry and to act as a detergent and astringent, içici

MEDICINE. Roots

432 Boot-bark 433

> Julce. 434

Rade 435

considered distretic, and was formerly employed in obstructions of the liver and soleen, amenorrhoga, and chronic rheumatism "

Chemical Composition -"The root-bark is said to contain a neutral bitter principle of sharp irritating taste, and resembling senegin flower-buds, distilled with water, yield a distillate having an alliaceous odour. After they have been washed with cold water, hot water extracts from them Capric acid (C10H20O2), and a gelatinous substance of the Pectin group. Capric acid is sometimes found deposited on the calices of the buds in white specks having the appearance of wax (Rochleder and Blas \" (Watts' Dict . Chemistry)

Food -In Europe this furnishes the Caper Mr Edgeworth found the buds (prepared in the style of "Capers") to answer very well as a substitute for the European congener. In India the ripe fruit is either eaten raw or made into pickle. In Sind and in some parts of the Paniab, a compound of oil, mustard, fornu greek, &c . is used in pickling capers In Ladak the leaves are eaten as greens

Fodder -The leaves and ripe fruits constitute a favourite food of goats and sheep.

## Capsicum or Red Pepper.

CHEMISTRY.

It is obtained by treating the alcoholic extract of ether, and is a thick yellowish red liquid, but slightly soluble in water. When gently heated it becomes very fluid, and at a higher temperature is dissipated in funts which are extremely irritating to respiration. It is evidently a mixed substance consisting of response and faith matters.

substance consisting of resulous and faity matters
"Felletar, in 1850, exhausted capseum fruits with didte sulphuric
acid and distilled the decoction with potash. The distillate which was
strongly allaine and smelt like conine, was saturated with sulphuric acid,
evaporated to dryness and exhausted with absolute alcohol. The solution, after evaporation of the alcohol, was treated with potash and

isolating it in sufficient quantity to allow of accurate examination

"Dragendorff states [1871] that petroleum ether is the best solvent for the alkaloid of capsicum, he obtained crystals of its hydrochlorate, the aqueous solution of which was precipitated by most of the usual tests, but not by tannic acid.

"The colouring matter of capsicum fruits is sparingly soluble in alcohol, but readily in chloroform. After evaporation an intensely red soft mass is obtained, which is not much altered by potash, it turns first blue, then black, with concentrated sulphurue and, like many other yellow colouring substances. By alcohol chiefly palmatic and is extracted from the fruit, as shown by Thresh in 1877.

The crystals melted at 38°C On keeping them for some days at the

OF LIME deprived of its

into Calcic Hydrate (CaH2O2) which on being mixed with sand forms more or cement "As an earth, lime is properly disseminated in nature. as a rock, it enters largely into the composition of the earth's crist, it is less or more diffused in all its waters, it forms the principal ingredient (earth of bone) in the skeletons of the larger animals, and is secreted by many classes of the invertebrate to form their shells, crusts shields corals, and other means of protection Economically it is also of vast importance, being used in the manufacture of mortars and cements in tanning, bleaching, deodorising, and the like, and also in agriculture as a fertiliser or promoter of vegetable decays" (Page)

### TORMS OF LIME USED IN INDIA

There are three kinds of lime used in India (a) lime prepared from limestone. (b) lime found on the surface of the ground and known as kankar, and (c) lime prepared from fresh-water or marine shells.

#### (a) LIME PROM LIMPSTONE

LIMESTONE 400

Speaking of the distribution of limestone and marble, Mr Ball in "Economic Geology' says "Limestones can hardly be said to be his "Economic Geology' says "Limestones can hardly be said to be absent from any of the formations in India, though in some they are either rare or so impure as hardly to deserve the title. In the metamorphic series, bands of crystalline limestones occur locally in some abundance

found in the Bhanrer group, where they sometimes attain as great a thickness as 260 feet, and are used both as a building stone and for lime

"In the Gondwana series, limestones are rarely met with, and then chiefly in the Talchir and Ranigani groups, where they occur as lenticular or concretionary masses

"In the rocks of cretaceous age, within the peninsula, limestones of both sedimentary and coral reef origin occur The other sources of lime are principally sub recent and recent tufaceous deposits of kankar, traver-

"In the extra peninsular regions the principal formations containing I mestones are of carboniferous, jurrassic cretaceous, and nummulitic ares Another source of lime is recent coral. On the whole it

502	lime
503	distinct.  In the Andaman Islands, an important supply of lime, for Calcutta, is afforded by the coral reefs  The writer has been favoured, by Mr. H. B. Medlicott, with the following brief account of the important commercial limestones of Inda—  Lime is a scarce article in many parts of India. Much of the lime used in Calcutta is carried many hundred miles by river and railway. The want of a pure limestone flux at moderate cost has been the chief difficulty ir working the iron furnaces in the Raniganj coal-field. The most general source of building lime in India is Kankar or kunkur (meaning gravel), a granular or nodular stone found on the surface and in the sub-soil. It is purely of secondary ongin being formed on the spot by the evaporation of the ground-water, containing in solution more (  in North Western India, the lumps of kankar often coalesce into a continuous mass, fit for use as building stone. A stone so formed must of

Indian Lime

CARBONATE OF LIME.

(b) KANKIR OR CONCRETIONARY LIME. KANKAR (KUNKUR) .- "Throughout the plains of Upper India the principal source of time is the kankar which is found in nodules and layers of various sizes in the clays of the Gangetic alluvium. It yields an excellent but somewhat hydraulic lime" (H. B. Medlicott. See also

the remirks under Limestone.)

- 'tankar' (which really means any kind I for concretionary carbonate of lime,

and externally of a mixture of carbonate of lime and clay. The more massive forms are a variety of calcareous tufa, which sometimes forms thick beds in the allusium, and frequently fills cracks in the alluvial deposits or in older tooks

"In the beds of streams immense masses of calcareous tufa are often found, forming the matrix of a conglomerate, of which the publies are derived from the rocks brought down by the stream. There can be no

"As a flux for iron, kanker has been tried on several occasions, and l opinions are somewhat divided as to its applicability to the purpose; but oning to the uncertainty of its composition, it is distinctly less well adapted than rock limestones which have a well-defined average composition, even though in the latter the proportion of carbonate of lime may average something less.

"Block kankar has been largely employed as a building-stone, more particularly in connection with the Ganges Canal Works" (Rall)

Most of the roads in Northern India, and indeed in India generally, are metalled with kankar.

(c) SHELL-LIME.

CARBONATE OF LIME.

# MEDICINAL USES

Medicine—According to Duft, in the Hindú Vateria Viclica (p. 82) lime is used internally in dyspepsia, enlarged spleen, and other enlargements in the abdomen, and externally as a caustic. A mytter of lime, carbonate of soda, sulphate of copper and borax, is applied as a caustic to tumours and warts. It enters into the composition of several prescriptions for different forms of dyspepsia, such as Amiria vait and Agnikimara

Ainslie says the Vytians prescribe lime water mixed with gingelly oil and sugar in obstinate cases of gonorrhea: "Mixed with gamboge, quickline is applied externally to prinful and gouty limbs. It is also used as a caustic in the bites of ribid dogs" (\$\tilde{X}\text{rjun}, Bomb. Drugs)\$ The exhaustive account of the medicinal properties of lime given by Dr. Warings in his Basar Medicinus (\$\tilde{X}\text{sj}\text{mix} was be here quoted, since by doing so it will practically be unnecessary to refer to other authors —

MEDICINE.

518

lime is deposited at the bottom. In cases of emergency, as burns, &c., half an hour is sufficient for this purpose, otherwise it should be allowed to stand for twelve hours at least before being used. It is only the clean water which holds a portion of lime in solution, which is employed in me-

milk.

DOMESTIC AND OTHER USES

Manure. As a manure, lime plays an important part. It is largely

Domestic. Manure 524

are not so diversified as is desirable. A dressing from 1,000 to 5,000lb of lime may be applied per acce, according to the price at which the lime can be obtained '(II R Robertson, Agriculture, 13)

I me is often employed as a deodorising agent, "It is mixed with decaying regetable matter and with mimal bodies, with the view of bastening their destruction and preventing the except of offensive and novious effluxia. This effect time produces by its tendency, in common with the other caustic distinct, to carry the decomposition through the intermediate stages of putrelaction at once to the ultimate products" (Morton, Cylop, Agriculture, Vol II, 266)

Soap — Lime is used in preparing sorp according to Lunge's method, which is described thus "A flu-bottomed pain is preferred for making this soap, into which is introduced any given quantity of water and staked lime equal to 12 per cent of the weight of faity, matter. The whole is to be boiled and stirred when an insoluble hard lime sorp and a solution of glycerine are produced, when the latter may be drawn off from the bottom of the pain. A certain quantity of water and commercial carbonate of soda (the latter being slightly in excess of the quantity of lime used) are next added, and the boiling and stirring continued, when the hard.

carbonate flakes on sufficient the separimportant

Mortar and Cement —The use of lime in the preparation of mortars and cements is too well known to require any speem description. The following paragraph from Miller's Chemitrys, Part 11, 402, is, however, quoted here, as it will be found instructive: "The great consumption of lime in the arts is for the purpose of making mortars, and cements. Pure lime, when made into a paste with water, forms a somewhat plastic mass which sets into a solid as it dies, but gradually cracks and falls to pieces. It does not sposses sufficient cohesion to be used alone us a knotar, to remedy this defect and to prevent the strinking of the mass, the addition

525

burnt time, a suitable quantity of water is afterwards worked into it, and it is then applied in a tim layer to the surfaces of the stones and bricks which are to be united. The bricks or stones are moistened with water before applying the mortar, in order that they may not absorb the water from the mortar too rapidly. The completeness of the subsequent hadening of the mortar depends mainly upon the thorough intermixture of the lime and said.

arce of carbonate of po-

ceous annuals contain more pearlash than woody arborescent plants but even of the same plant the succulent young parts are more highly charged than mature tissues. Of different plants pures contain on an average only 0.45 per cent, oaks 0.75 to 1°5 per cent, vine shoots 5.50, ordinary straw \$8, ferns from 4.25 to 6.2, fludian corn stalks 17.5 nettles 25.03, wheat straw before earing 41.0, wormwood 73.0, and beet about the same amount.

These facts naturally suggest the plants best suited for the preparation

Indian Manufacture of

CARBONATE OF POTASH.

clarified and the crystallizable sugar extracted, the remaining liquor is SOURCES OF permitted to ferment, that the uncrystallizable sugar may be turned into alcohol and so utilized, but in the stills there will yet remain a waste liquor, and it is in this that abundance of potash salts occur. By evaporating this liquor in a long trough divided across into an evaporating and a calcining section, a salt is finally obtained, consisting of a mixture of potassium chloride, sulphate, and carbonate (together 50 or 60 per cent ) with insoluble matter and a good deal of sodium carbonate. The potassium carbonate forms about one-third of the weight of the calcined mass, and arries in a great measure from the destruction, during the calcining process, of the po assium oxilate, tartrate, and nitrate which occur naturally in the beetroot, and, consequently, in the liquor from the still" (Prof Church in British Manuf Ind.) This instructive account of the extraction of carbonate of potash from the waste of beet-root has been repro-duced here because of its direct bearing on many of the native contrivances employed in India for the preparation of pearlash. It would be almost impossible to over-estimate the extent to which a crude carbonate of potach is employed by the people of India. In another volume under Alkaline Ashes (A 759, also A 1626) will be found an enumeration of the principal plants used by the natives of India for that purpose, and these should be compared with the plants given under Benila (B. 163) as employed in the manufacture of carbonate of soda. Although in India immense tracts of mountainous land are injuriously covered with various species of wormwood (see Artemesia), except as a manure, the ashes of these plants are not apparently utilized. From the high percentage of carbonate of potash which the wormwoods contain, the preparation of pearlash might be confidently recommended to the poorer inhabitants of these regions as a useful new industry. A large export trade might reasonably be anticipated from the Himálayas to the plains of India, if not to fore gn countries

While this is possible, an equally profitable industry might also be organised in preparing the carbonate from the injurious amount of saltpetre

Wormwood Ash. 530

MEDICAL OPINIONS.	
FOOD Ripe first 580 Green fruit Curries and propose 500 500 500 500 500 500 500 500 500 50	other methods were used the matter is open to doubt." (Surgeon W. G. King, M. B., Madrai). "The leaves are used externally for nervous pains. The leaf may be either dipped in hot water or warmed over a fire and applied to the painful part" (Surgeon Major W. Alam. M. D., Bombay). "The seeds are considered to be anthelimitic." (Surgeon Major J. Robb, Almedabal).  The above opinions show how widely and uniformly the properties of the papeya are believed in by Native and even by European Medical Officers.  Food—When tipe the fruit attains the size of a small melon, the interior is soft, yellow, and sweetish, eaten by all classes and esteemed innocent and wholesome. When green it is cooked by the natives in their curries and also pickled. The ripe fruit has a flavour peculiar to itself, the better qualities are eaten without sugar, and by many persons are ranked among the first of eastern fruit. By others the papeya is eaten with pepper and salt. The seeds have a pleasnity pungent taste, not unlike mustard, hence in all probability the idea occas onally alluded to that this is the mustard tree of the scriptures. Lisboa asyste fruit has a sweetish toste and makes an excellent tart. When boiled in slices it is eaten as a vegetable. Don asys that in South America the fruit after being boiled and mixed with lime juice and sogar is used in place of apple sauce. Sloane remarks that the unitype fruit is cut into slices and seaked in water till the milky juice is removed. It is then boiled and eaten as turnips or baked as apples. A few drops of the milky
Julce. 592	sap of the papaw is said to render meat tender. The author of the Mahkan recommends that for this purpose the juice should be mixed with fresh ginger. In Barbadoes the flesh of animals is reported to be hung on the tree over night in order to soften it. This idea prevails allower India and is doubtless often resorted to by domestic servants. Drury confirms this and states that he has personally tested the accuracy of the popular notion. Dr. John Davy [Edin. Ph. I., 1855] declares that this is due to accidental causes. According to some writers the best plant osoften meat is to wrap it overnight in the papaw leaves, or to drop a little of the fresh juice into the vessel in which the meat is being cooked. Brandis mentions another process, namely, to wash meat with water impregnated with the milky juice. It is even stated that meat is rendered tender by causing the animals to eat the seeds before they are killed. The best qualities of papaw are said to be obtained from Singapore and Moulman stock. The green fruit, when pesied, boiled, cut into small pieces, and served with sweet oil, vinegar, salt and pepper, serves as a very palatable vegetable, and is very similar to squash in taste." (Mr. L. Liotard).

#### CARMINE.

Carmine and Carminic Acid.

CARMIN, Fr.; KARMIN, Germ.; CARMINIO, II.

References.—Balfour's Cyclopad; Ure's Dictionary of Arts, Manuf, and Mines.

A pigment of a bright red colour, made from cochineal and alumina, or behiotide of tin. This is prepared by throwing into a decotion of cochineal a certain proportion of the base employed. A salt is produced which is allowed to precipitate in shallow basins. The colourless liquid is decanted and the powder carmine dried and preserved. By the old German process carmine is prepared with alum?

The uses of Carmine have recently been greatly extended. It is employed for making fine red inks and for silk-dyeing. It is the finest red the water-painter, and more especially the miniature painter, possesses The French carmine and rouge is preferred to the English. See Cochineal.

Carnation. See Clove.

## CARNELIAN.

The Condition of the Architecture of the Chalcegook that morated such also exists. I has had been to the classification of the quartitose minerals into—

ist-Transparent Crystallised Quarts or Anhydrous Quarts, as represented by the Rock Carstals. These, when violet, are known as the Amethyst, and when yellow or sherty-coloured as the Cairngorm, but numerous intermediate shades also exist from red to black.

and—Uncrystallised or Crypto-Crystalline Anhydrous Quarts—This corresponds to the Chaledony series, but by most writers this is also made to include Jaszer, an opaque rock of undefined nature rather than a definite mineral. The term Abazz is sometimes given generically to denominate this series, or Agate and Chaledony are used as synony mous terms

1rd-Uncrystalline Semi-transparent to Opaque Hydrated Quarts -The Oral may be given as the type of this group,

#### QUARTZ.

The quartzose stones referrible to the above sections are extensively used in India for ornamental purposes, in the lapidaries' art, in decorative architecture, and in the manufacture of cheap jewellery. They are popularly assigned a position with the "inferior gems"—the diamond,

were apparently not known to the ancients, and when first brought to their attention obtained fabulous prices. Pllny mentions that fragments of a small Cambay cup were exhibited in the theatre of Nero, "as if." adds Pliny, "they had been the ashes of no less than Alexander the Great himself." Balfour remarks with much truth that "amongst the people of India the inferior g

Exports of Inferior Gems.

C 441 -

CARNELIAN.

\_\_\_

wood 7 64 per cent, cutch 2 56 per cent, and jade-stone 3 51 per cent. From the table given above it will be seen that the exports of jade during that year were exceptionally high, but it may safely be added that jade still holds a position as the fowth or fifth most important article of export from a burns, and that will not make the mobile given may in this future be considerably extended. The exceptional divelopment of the trade in 188182 was due to the discovery of a new mine and the decrease that followed accounted for by the jade thus sent into the market having proved much inferior to the stone usgally exported

An infenor quality of jade-stone is also found at Mirzapur, and a very considerable trans-frontier trade is done in the Panjab in Kara-kash jade from Turkistan, and in jade and imitations of jade or false jade from Kashmir, (See on a further page, under Agare, variety

plasma)

We have alluded to jade in the present connection, not from an established belief that it belongs to the quartrose group of minerals with which we are at present dealing, but because it is one of the so-called inferior gens. The chalcedony and rock crystal gens, however, are even as extensively employed in India as jade-stone, yet it has been found difficult to furnish definite data treatment ghe extension of the miternal and foreign trade in these Perhaps the most interesting of the early accounts of the Cambay tate and maturity in "Cambay stores" and

## The Rock Crystal.

We must now describe, as briefly as possible, the principal quartzose inferior gems -

#### ret -ROCK CRYSTAL., Mallet, Maneralogy, 62.

Vern — Bilaur, Hind., Phatak, Gujrati, Tansala (smoky Cairagorm),
PB The Burmese name for an Amethyst signifies "egg plant, Sapphire" References —Balls Econ Geol, 502, Balfour, Cycl of India; Bomb Gas, VI, 201 Mason & Burma (1800), b 570, Colculta Jour hat Hist, II Madros Jour, Li and St., VII, 172 Mysore Got, I, 20; Central Prov Gas, 505, Oldham, Jour As Soc, Beng, XXIII, 271

CHARACTER or -When pure this mineral consists chiefly of silicic acid . it is an oxide of the carbon-silicon group the differently-coloured forms of rock-crystal owe their tints to the presence of small quantities of foreign minerals These coloured crystals are known by various names such as the Amethyst, Cairngorm, Rose-quartz, Pellucid-quartz, False-to-

paz or Citrine, Smoky-quartz, Milky-quartz, Prase, Aventurine-quartz, &c are. how-

ignorant account ed from nged reo a tinc-

ture of red sandal, it takes a deeper red tint, into tincture of saffron, a vellow, like the topaz, into a tincture of turnesol, a yellow like the topaz, into a mixture of tincture of turnesol and saffron it becomes an imitation of the emerald" Crystals coloured red are known in France as rubaces or false rubies.

PROVINCES WHERE MET WITH -Rock Crystals are very abundantly met with in South India, as, for example, at Vellum in Tanjore, in the Godavery basin, and at Hyderabad In the Bombav Presidency they are found at Tankara in Morvi Blocks from one to twenty pounds are found as clear as glass and capable of taking a high polish (rock crystals are also imported into Cambay from Ceylon and China) They are by no means uncommon at Sambalpur in the Central Provinces Agates and quartz in great ımahál hills in Bengal

Bannu, Sháhpur, and size have been found

d crystals as rubies large crystals are found in their country. Milky-quartz occurs in Mergut

stones, the value being about the same as garnets The crystals of Sambalpur are not worked and they have accordingly no local value. At the loot of the Delhi palace a number of vases, pitchers, drinking cups, &c, cut in transparent quartz were found. These are supposed to have been cut out of large crystals found at the Arvalı quartzites in the neighbourhood. The Shans of Upper Burma are said to be experts at making imitation gems from rock crystals.

C. 616

\_

The Agate. 2nd -AGATE, Mallet, Mineralogy, 70 CARNELIAN. AGATE. 617

The name Agate is supposed to be derived from the achates (axarus) river in Sicily, or from akik, a river, in Arabic Agare Fr , Achat, GERM , Akik, ARAB, Lamni, HIND (agate), Chakmak (a flint), HIND, Manka, HIND (cut agates and beads brought from Kandahar), Asshar, HIND (Silica), Pathanns, HIND (blood-stone)

They are commonly known to Europeans as Cambay stones or Goda-

very pebbles

References — Hamilton, Capt (1981), New account of the East Indies, I 143, Hore, Dr (1987), Explorations in Bombay, Sel Rec Bomb Gord, VII, pp 491651 knnniet, Dr (1882), Fran Med & Phys Soc, Cele, IIII, 425 Wallace, Myor (1884), Sel Rec, Gord, Bomb, Viver

Sources -Indian Agates are mainly obtained from the mines of Rewa Kantha in the Bombay Presidency, but they exist also in Bengal in the Raimahal and Singbhum districts, in Hyderabad, and in the Central Provinces at Jabulpur Cal P

jamo The colour varies, but is generally a greyish white Both kinds come from north east Kathiawar, near Mahedpur in Morvi, three miles from Tankara Of the stones which lie in massive blocks near the surface, the most perfect do not exceed five pounds in weight, while those of inferior quality, in many cases cracked, weigh as much as sixty pounds. These stones are by a global to the Comb.

AGATE

showing either a dark ground with white streaks, or dark veins on a light black ground."

CIREACTER OF —Agates are concretionary masses or nodules, which occur usually in hollows or veins in volcanic rocks. When cut across the sections show layers. "The colour markings are often in concentricings of varying forms and intensity, or in straight parallel layers or hands. The colours are chiefly grey, white, yellow or brownish red." The composition of most of the forms of agate and carnelian is from 70 to 60 fer cent of silica, with varying proportions of alumina, coloured by

by the more porous layers of the stone; it subsequently becomes carbonised, and thus the contrast of the various colours is heightened. The

It is not contemplated in the present article to do more than draw attention to the main facts regarding the Indian Carpet Industry, the object being more to indicate the nature of the carpets made, the materials of which they are were and the dies employed in their coloration, than

there are carpets woven by the warp horzontal, and others in which its vertical. The former are chiefly cotton carpets and the latter nearly always woollen, although it is frequent in both classes to use cotton or hemp for the warp and wool or hair for the woof. The warp, with the single exception of the so-called Jabbalpur dari, is not coloured, but the wool is so manuplated that in both these classes of carpets it covers the warp. The Jabbalpur daris are almost precisely of the same character as the Kidderminister or Scotth carpets—a certain proportion of the pattern being developed by the coloured warp which may be either in bands of different shades or of one uniform colour. In such carpets longitudinal or checked patterns are produced, whereas in the ordinary dari or cotton carpet the patterns run across the warp

Popularly the terms dari and satranji are applied synonymously to cotton carpets, but in more precise language, the former is a rug

It is not contemplated in the present article to do more than draw attention to the main facts regarding the Indian Carpet Industry, the object being more to indicate the nature of the carpets made, the materials of which they are woven and the dyes employed in their coloration, than to treat of the historic and artistic features of the manufactured articles Indian carpets may be classified either according to the nature of the materials of which they are made or the manner in which they are woven. There are cotton, woollen, silk, goat s-hair, yak's hair, and pashm carpets, or mixed carpets of any two or more of these materials. Then again, there are carpets woven by the warp horizontal, and others in which it is vertical. The former are chiefly cotton carpets and the latter nearly always woollen, although it is frequent in both classes to use cotton or hemp for the warp and wool or hair for the woof. The warp, with the single exception of the so-called Jabbalpur dari, is not coloured, but the wouf is so manipulated that in both these classes of carpets it covers the warp The Jabbalpur darss are almost precisely of the same character as the Kidderminister or Scotch carpets-a certain proportion of the pattern being developed by the coloured warp which may be either in bands of different shades or of one uniform colour. In such carpets longitudinal or checked patterns are produced, whereas in the ordinary dark or cotton carpet the patterns run across the warp.

Popularly the terms dari and sairanji are applied synonymously to cotton carpets, but in more precise language, the former is a rug or small cotton carpet and the latter a large one. Daris (=dar, a door, daris la not a not a large one)

that have to be taken up for the first row. The workmen repeat in chorus what the overseer says, and fix up the loops, tie a knot, and cut the pieces off As soon as the first row is ready, a west-yarn is passed between the two sets of the warp, and is fixed tightly in its place by the aid of a fork like instrument called the heckle. In this manner row after row is laid up, till the whole of the carpet is woven, when it is taken down from the loom, spread on the floor, and sheared.

"Persian carpets vary in price, according to texture and design, from 14s to £1-8s (R7-R14) the superficial square yard There are (1882) seventy five Persian carpet weavers" (Bomb, Gar, XIII . District 401)

PRISENT POSITION AND FUTURE PROSPECTS OF THE INDIAN PILE CARPET INDUSTRY.

cotton threads, which are soft in texture and not made hard and tight by over-twisting and sizing On these wool thread is tied and the allowance of wool is very liberal The looms are large enough to make any size of carpet, and there are, therefore, no seams For ordinary English TEN CAFFA A 6 a tere is very frequently an unde on the back or front of the mess to the fabric this 4 htly woven, a long needle bold drawal of the knife with

DYE.
Estimation of Quality.

661

The quality of safflower cake is estimated by dyeing a known weight of cotton; about 4 ounces of safflower will dye 1h of cotton loth light pink; 8 ounces will dye it full rose-pink; and from 12 ounces to 1h will dye it a full crimson In order to take up this quantity, the cotton must be several tumes dwet in fresh solutions of the colouring matter.

Chemical History.—It is scarcely necessary to go into great detail re-

Two yellows and one red.

Carthamin

36 per cent. of the florets, while from 0.3 to 0.6 per cent. is the usual amount of Carthamin. The proportion of Carthamin present varies, however, in the inverse ratio to the amount of the soluble yellow principle. The second yellow colour is coubled only in an alkaline liquor.

If the dye-stuff, after the removal of the soluble yellow principle, be acidulated with acetic acid, filtered, and first acetate of lead and next ammonia added, the second yellow colour will be precipitated along with

of the florets). In India pearl-ash is most frequently used, especially that prepared by incinerating bajra (Pencillana spicata) or of chir chira (Achyranthes aspera), (impure potassium carbonates), but the natural earth carbonate of soda or sajji-māti is also frequently employed for this nurnose.

Fixing Safflower Dye.—It is much to be regretted that no one has as

FIXING 668

Fixing Satiower Dye.—It is much to be regretted that no one has as a classocwered a mode of preventing the decoloration of satiower dye, its fleeting property appears to depend on the ovalation of the particles of carthamn held mechanically in the fabric. The inhabituation of different parts of the control of the part of local officers may help to throw some light on the subject. All that is mecessary to re-stability the carthamne dye as an important industry is the discovery of some mode of preventing this oxidisation of carthamn. The fruit of Garrian pedanicalta, a common tree in Assam, has already been alluded to

extensive use justifies this

us that the dyers of Chittagong district claim to be able to produce a "semi-pena nent" safflower dye. This is done by adding safflower to water in which

acturlly made use of now and then as a discharge, so as to produce a yellow pattern upon a pink ground, weak acids do not affect the colours, but chlorne and sulphurous acid destroy the colour at once" (Crooket) Safflower dyed fabrics should not be washed with soap, as the colour is removed by the ilkali of the soap

Rouge — It is necessary to refer here very briefly to an important purpose for which safflower is employed, vis, the manufacture of rouge

CARUM Roxburghianum

these seeds he give the name Cammaigrum, without apparently having either seen the plant or ascertained any thing more about them. Stewart seems to have gone into the subject for he reduces Royle's C nigrum to C Cam. In this view he uppears to be supported by Mr. C B. Glarke in the Riera of Bertish in hin, since Royle's by that author quieted as hiving found the true caraway in Kashmir and Garwhal I in what has been already said under C. Cam this opinion has been supported, but at the same time it must be added that Dr. Dymock and many other writers continue to allude to a black form of carawix. Dr. Dymock says. "Sojira or Suh arank (Romb) has more slender and driker-clouder fittish that the true caraway, a transverse section shows a similar structure. The flavour approaches that of Cummin, and the Persain mane which it bear signifies black cummin. It is probably the article described in Persain works on Materia Medica.

Habitat.—A beautiful palm, with smooth, annulated stem, met with in

The forests of the western and eastern most zones. On the Western Ghats, it extends to near Mahableshwar. In the Settlement Reports of the Chanda district it is stated that this palm abounds in the southeastern corner of Aheree, and might with advantage be extended to all parts of the district, for it thrives well wherever it is planted. It is common in Burma, Bengal, and Orissa, ascending in Sikkim to 5,000 feet.

Fibre.—"The leaves give the Kittul Fibre, which is very strong and is made into ropes, brushes, brooms, baskets, and other articles; the fibre from the sheathing petiole is made into ropes and fishing-lines" (Gamble), and is said to be suitable for paper manufacture

At the Colomal and Indian Exhibition (1886-87) much interest was taken in salopa fibre sent from Ornssa, Burma, and Kolaba in Bombay. A corset manufacturer applied at the office of the Indian section for fibre which might take the place of whalebone in corset-making. He was shown the salopa (kittur) fibre and also the similar cord like fibres from the interior of the stems of the cocoanut and palmyra palms. It

FIBRE. 712

1

Ceylon At the Colonial and Indian Exhibition he pointed out to the writer a sample of the much inferior kithul like fibre from Arenga sacchariera (see A. 2356) as the kithul he had formerly seen as sent from India He admitted that the sample of salopa shown him at the Evhibition was

many parts of Ind a The Flors of British India says C angustiolia, 'has no cla m to be considered nodgenous to India 'C lanceloida, Forth, is a native of Araba. It seems probable that the mistake made by Dr Brandis gave ongun to the statement (see Pharmacographia, also Bentley and Trimen, Med. Pl.) that C angustifolia is indigenous to Sind and the Panils.

The cultivated plant as met with in India is the Tinnevelly Senna of commerce and the uncultivated the Bombay Senna or Sonna Mekki or Sana miki Sona maki of the East. The last mentioned is imported into India from Arabia. In Bombay it is cultivated at Poona to supply the requirements of Government Hospitals and not as an article of commerce Stocks say it is grown in Sin.

Botame Dagooss —This species is closely related to the preceding, but the leaflets are usually \$8 jugate, are narrower, hengo oval, lancelotac, tapering from the middle towards the apex, they are longer, often nearly 2 inches long, and are either quite glabrous or furnished with a very scanity pubescence. The legume is narrower (7-8 lines broad), with the base of the style distinctly prominent on its upper edge.

Description of the Drug -This plant thus affords two of the commercial forms of senna -

1st TINNFVELLY SENNA—This is the leaf obtained from the plant carefully cultivated in South India and (at Poona) in Bombay Owing to greater care in its collection, I indevelly senna is of better quality than the Arabian article The leaves are also larger, being 12 inches long of

Tinnevelly.

Dr Dymock says that large quantit es of Tinnevelly senna are now sent to Bombay and that so successfully does this Indian article compete in the market, that if e importation of Araban senna is rapidly declining, Tinnevelly senna being exported to Europe in its place

Arabian. 730

CEDRELA serrata

#### The Toon woods

In the Monograph of the Meliaceæ published in 1878 by Casimir de Candolle, the species of Cedrela formerly grouped under the one head of Cedrela Toona, Rosb, have been separately described.

They are thus distinguished —

Ovary glabrous-

Leaflets petioled
Leaflets subsessile

Ovary hairy—

Leaflets acute at the base Leaflets round at the base

No + Dond os flove and -- + f

C serrata, Royle C glabra, C de Cand

C Toona Roxb C microcarpa, C de Cand

Mr Gamble, in his Manual of Timbers XII, remarks that in his "Trees, Shrubs, and Climbers of the Darpling District, three varieties were spoker-of and separated as tollows —

N

ber December, bark I ght es, found in the upper hills

"No 1 is C Toona, Rosb No 2 probably C microcarpa, C de Cand No 3 probably C glabra, C de Cand It would however, have probably been better to describe No 1 as 'deciduous in the cold season,' and Nos 2 and 3 as 'deciduous in the rains' There is perhaps a fifth species

"They may also be distinguished as follows by the capsule —

Capsule smooth { capsule round C Toona, long pointed C microcarpa C glabra

"Of the Northern Bengal specimens which we have examined, E 360 and E 7333 will be C glabra, while E 655 E 2332, E 3509 E 3619 and E 3623 will be C microcarpa Some of the Assam, Chittagong, and Burma specimens are probably C microcarpa

Burma specimens are probably to metacarpa en; is probably C multiples, Kurs, 1, 29, 20 Feb. 200 May 20

The preceding remarks may for the present be accepted as ind cating the Nepal plant, C glabra, DC, and the Sikkim C merocarpa, DC, as

Flowers	extract of the bark in chronic infantile dysentery. Blume attributes valuable antiperiodic virtues to it, and in this character it is favourably noticed by Dr. J. Kennedy (Ann of Med., 1796, Vol. 1, p. 387). Dr. R. Ross speaks of it as a reliable antiperiodic, and Dr. J. Newton as a good substute for einchona. The dose of the dried bark is about an ounce daily in the form of infusion. The powder of the bark was found by Dr. Kennedy to be of great service as a local astringent application in various forms of ulceration. According to Dr. Dymock, the native physicians use the bark in combination with bonduc nuts as a tonic and							
843	antiperiodic, a fact also mentioned by Ainstein in his Materia Indica. The ELOWERS are called Gul-lair in Bombay and considered emmenagogue. "The bark was used in Java by Blume in epidemic fevers, diarrhea, and other complaints. Horsefield gave it in dysentery, but only in the last state, when inflammatory symptoms had disappeared." (Bafyur)							
FOOD	Food -The seeds are used to feed cattle. The young shoots and

Habitat — A very large and tall tree, found in the North-West Himalaya, between 4 000 and 10 000 feet, extending east to the Dauli river (a tributary of the Altikanada below the Niti Pass), in the mountains of Afghanistan and in North Belochistan

Gum -It yields a true oleo resin, called Kelon-ka-tel The preparation

of this oleo resin is thus described by Mr. Baden Powell —
First, an earthen gharn, or vessel with a wide mouth, and capable
of containing about 4 seers, is sunk into the ground. Next, a large
gharn of about 25 seers capacity is taken, and three small holes are
dolled in its under ade, it is then filled with scraps of the pine wood,

CEDRUS Deodara.

#### The Deodar or Himalayan Cedar.

remedy for ulcers and eruptions, for mange in horses and sore feet in

cattle" (Gamble, 406)

MEDICINE

Medicine -The aromatic wood is employed medicinally as a carmi-

stomach could bear. Its use may be extended to other skin diseases with advantage Dr Royle states that the leaves and small twigs of the Deodara are also brought down to the plains, as they are supposed to possess mild terebinthenate properties (Plarm Ind) In Kangra the wood is pounded with water on a stone, and the paste applied to the temples to relieve headache Assistant Surgeon Sakharam Arjun describes the wood as a bitter stomachic, useful in fever, costiveness, piles, and

pulmonary complaints Food -The young shoots and plants are eagerly browsed by

goats, &c Structure of the Wood -Heartwood light-yellowish brown, scented, moderately hard In each annual ring the outer belt of firmer and

the edge of certain annual rings are frequently found concentric strings of dark-coloured pores or intercellular ducts, which are prominent on a vertical section as dark lines, and in the vicinity of which the wood is sometimes more resinous.

In common with most species of the Order, the Deod ir has well marked annual rings which, there is little, if any, reason to doubt, each repre-

CEMENTS. 904

# CEMENTS.

CIMENTS, Fr.; CAMENTE, KITTE, Ger.

The term "Cement" is applied to a class of substances used for uniting two bodies, and which ultimately harden and bind them together. The following classification of these substances from Spons' Encyclopædia may be here given: (a) Calcareous cements, (b) Gelatinous cements, (c) Glutinous cements, (a) Resinous cementing compounds, and (e) Non-resinous cementing compounds. Interesting information regarding the Cements of India will also be found in Bilfour's Cyclopadia of India.

> Calcareous. 905

from 10 to 25 per cent of alumina, magnesia, and silica, yield a lime, on burming, which does not slake when moistened with water, but forms a mortar with it, which hardens in a lew days when covered by water."

cements. (See Cocoa-nut Juice under Cocos nucifera)

(b) GELATINOUS CEMENTS -These have their origin in the substance known as "gelatine" obtained by boiling animal tissues in water. It is separated from water by simple evaporation, when it is converted into a dry hard substance called by different names, such as "glue," "size," "isinglass," &c, according to the sources from which they are derived.

Of these, "glue" and "size" are employed as cements, and in India a strong and useful glue, made from cartilage obtained from fish, is used by every jeweller and gold-leaf beater.

(c) GLUTINOUS CEMENTS -The base of this class of cements is a sub- Glutinous

this class of substances are due to the presence of resin, gum-resin, or gum, such as common rosin, india-rubber, gutta-percha, gum arabic, &c. The following are a few of the Indian plants which are known to afford sub-

stances used as cements :-Cratæva religiosa (fruit). Adenanthera pavonina (seeds). and Dichopsis elliptica (gum). Ægle Marmelos (glutinous tenscious matter).

Artocarpus hirsuta (juice). A. Integrifolia (juice). Balsamodendron Roxburghii (gumresin)

Bauhima retusa (gum). Borassus flabelliformis (juice). Euphorbia Cattunandon (milky juice) E. Royleana (juice).

Feronia Elephantum (gum), Tamarindus indica (seeds). Typha angustifolia (down of the ripe fruit).

CULTI-VATION.

creasing costiness of the drug, have occasioned active measures to be taken for attempting its cultivation in that country. Though known for several years as a denize of botanical gardens, the inecacianha plant has always been rare, owing to its slow growth and the difficulty attending its propagation.

culty has The first

had been standing every care, the plants could not be made to thrive. Three plants, which had been sen to the Rungbi plantation in 1868, grew rather better, and by adopting the method of root propagation, they were increased by August 1871 to 500. Three consignments of plants, numbering in all 370, were received from Scotland in 1871-72, besides a smaller number from the Royal Gardens, Kew. From these various is

conditions as regards sun and shade, but thus far with only a moderate

Ur. King reported to the Director of the Royal Botanic Gardens, Kew, in 1877, that he had distributed plants from the Calcutta Botanic Garden to Ceylon, Singapore, Burma, and the Andaman Islands, and also stated

however, fortunately not been realized, and the drug is now obtainable at pretty much the same price as twenty years ago "

In South India cultivation seems more hopeful than in Shlaim. The late Mr. McIvor, in May 1870, planted a few Jeecacunha plants in the Botanic Gardens at Barluyar. These succeeded fairly well, but in 1881 82, Mr. Lawson, the present Superintendent of the Botanic Gardens, reported that he did not think the plant could be there grown as an article of commerce. Later on, he seems to have attained more confidence in the pos-

been made above, that gentleman says of the South Indian experiments

could not produce the drug in any quantity at the usual market rate (from a to 5 shillings per pound), at which it can be bought in London "In an otheral communication dated May 1887 Dr. Bidie writes hopefully

PROPAGA-TION.

efforts. Dr. King, in his paper read before the Agri-Horticultural Society. indicates clearly the peculiarities and necessities of the plant, and in his more recent communication (the official papers referred to above) he reiterates more strongly the same opinions, "There can be no doubt that the occurrence of a distinctly marked cold season is disadvantageous to the growth of Ipecacuanha. I sent plants of it for trial to the Andaman Islands and Singapore, both being localities where there is no cold season. But at neither place has the cultivation been much of a success. I had an opportunity of seeing, in the Singapore Garden, during the year 1870. the Ipecacuanha plants which I had sent from Calcutta, a year or two pre-And contrary to my expectations, I found them growing very The plants sent to the Andamans I have never seen, but indifferently I understand that they did not come to much"

Large numbers of plants have been freely distributed to private cultivators, but it may be concluded that it still remains to be demonstrated whether or not the medicinal properties are preserved in the Indian cultivated stock. These may improve as in the case of some of the Cinchonas, but on the other hand, they may decline, so that it must be concluded Ipecacuanha in India is even now but in its most early experimental stage.

1-1---

EDICINE. Root. 017

> I ne treatment of this disease by large doses of Inecacuanha (grs. xxx to grs. lx), of late years re-introduced, has been found most effectual. In diarrhoea, and in some forms of dyspepsia, especially when connected with functional derangement or torpidity of the liver, it acts beneficially, As an expectorant it is in common use in catarrhs, chronic bronchitis, asthma, phthisis, the early stages of hooping-cough, &c. In hæmorrhages, especially in uterine hoemorrhages and in menorihagia, it has proved an effectual remedy. For removing crude and indigestible matter from the stomach, Ipecacuanha acts with certainty and safety as an emetic, without inducing nearly the same amount of subsequent depression that follows tartar emetic, it is especially adapted for childhood and for persons of a delicate constitution As a counter-irritant (2 drs. of powdered Ipecacuanha incorporated with 2 drs of olive oil and 4 drs. of lard, rubbed into the skin for a few minutes, once or twice daily), it has been advan-

chemical nature. In the process of been-brewing two manifestations of the same kind are met with. The grain from which the beverage is to be prepared is first moistened either with hot water or by being placed in a transplace. As the result, it sprouts or germinates. The chemistry of this action consists in the fact that is a warm mist starch of the grain converts the latter into sign. Disastes may be defined as a transformed condution of gluten produced within the seed during the first stage of germination, and we sooner is the disastes formed than it immediately commences to act upon the insoluble starch. This is a wrise provision of nature. The timbroy polant is imbedded in a mass of starch. The base of the embryo contains glutten, but both starch has the provision of nature. The timbroy plant is imbedded in a mass of starch. The base of the embryo contains glutten, but both starch and glutten are insoluble, and cannot be transformed into the structure

new substance is rapidly absorbed, and for the first period of its existence the infant plant feeds upon the food stored up for it within the seed. It

witen the mississe completes its action on the still insoluble statch. It has been found that for every 100 parts of starch, in good milt, ilb of diastase is produced, but that quantity will suffice to convert the starch of 1,000lb

brewer niters the wort, for the boiling has not only killed the diastase,

956

nourishment these minute plants take has never been clearly established,

in some respects better than the beers that used formerly to come to this country in such large quantities. The yeast is killed by the process of heating to 60°. In the brewing of beer only about a quarter of the fermentable substance is converted into alcohol, the remainder giving the

or Torula Cerevisiae

#### The Common Gram

These remarks regarding anthrax have however, been made in this place mainly to prevent undue alarm, until Professor Wallace's suggestions regarding a possible connection between it and gram-feeding have been proved correct.

#### CHEMISTRY TOSA

## CHEMICAL PROPERTIES OF GRAM

Professor Church, in his Iood-Grains of Ioda, gives an interesting account of this pulse, but is in error in too prominently restricting the name grain to the forms of Phaseolis Mungo. This is the case only in the Madras Presidency, throughout the rest of India the terms black and green grain are practically unknown, the word grain signifying the pulse Giver arctinam, although the term horse grain is sometimes applied to the pea of Dolichos billoras. In Madras it might fairly well bear that name, since it takes the place of Giver arretinum as a food for horses. The Professor gives a valuable table as the result "of nine analyses of the unbusked greas and of four analyses of the peas from which the busk has

"The nutrient ratio in the unhusked peas is 1:33; the nutrient value is 84"

The unhusked peas are therefore more nutritious than the husked, and it may be concluded that the process of steeping them in water before

a high reputation.

## TRADE AND PRICES

Very little can be learned regarding the internal trade in gram. It is extensively eaten by the natives in every part of the country, and then must therefore exist a very considerable internal trade in the pulse. The grain could be most conveniently obtained from Bombay, Karachi, or Cal-

## C. 1085

TRADE.

or Chick Pes. CICER

The foreign trade is at present not very extensive. The following were the exports during the past five years:—

Cwt. R 183-53 312,933 815,647 183-84 32,644 11,09,795 183-85 33,1465 925,543 183-85 335,129 10,74,771 1835,85 36,079 9,84,046

The exports in 1870 were only 23,171 cst, valued at R94,900; but it

various Indian pulses The majority of these gentlemen agreed in

other.

Prices.—In a recent number of the publication issued by the Department of Finance and Commerce under the title of Frest and Wages in India," Mr. O Conor has published tables which afford perhaps the most trustworthy data for arriving at a knowledge of the price of gram; his figures represent seers (21b) to the rupee. Mr. O Conor's results of average prices may be thus summarised:

PRICES. 1086

	1	II	111	IV
	1873 to '76.	1877 to 380.	1881 to '84.	1873 to '80.
Madras Bombay and Sind Bengal North-Western Provinces and	23 63	17'77	32°05	20 7
	17 c6	11'47	18 43	24 27
	20 58	15'31	21°77	17'94
Oudh	25 61	18 36	24.22	22 48
Panjab	30 04	18 29	26.1	24 16
Central Provinces	31 02	18 1	24.23	24 56

It would, perhaps, be unaske to carry these figures lutther; but the mean of Column IV, might gue the render an average approximation of the retail price of gram in India. But it must not perfectly represently exported means more than the peak of Cater arietisms, and includes (as perhaps do the above figures) pulses that have a lower value than the true gram.

observed, was obtained by Broughton from a bark grown at Ootacamund.
This bark afforded not less than 132 per cent. of alkaloids, among which
quinine was predominant.

"The few facts just mentioned show that it is impossible to state even

quinine

"As to Cross or Losa bark, the Corta Canthone paids of pharmacy, its metts are, to say the least, very uncertain. On its first introduction in the seventeenth century, when it was taken from the trunks and large branches of full-grown trees, it was doubless an excellent medicinal bark; but the same cannot be said of much of that now found in commerce, which is to a large extent collected from very young wood. Some of the Crown Bark produced in India is, however, of extraordinary excellency, as shown by the recent experiments of DeVry.

"As to red bark, the thick flat sort contains only three to four per cent of alkaloids, but a large amount of colouring matter. The quill Red Bark of the Indian plantations is a much better drug, some of it yielding 5 to 10 per cent of alkaloids, less than a third of which is quante and a fourth cinchondine, the remainder being cinchonine and some-

times also traces of quinidine (conquinine)

"The variation in the amount of alkaloids relates not merely to their total percentage, but also to the proportion which one bears to another. Quinne and cinchonine are of the most frequent occurrence; cinchonidine is less usual, while quinnime is still less frequently met with, and ever; in large amount. The experiments performed in India have

HISTORY OF THE INTRODUCTION OF CINCHONA INTO INDIA.

Or. King writes "The practice of the bark collectors in the wild regions in which Cinchonan snaturally grow involved the destruction of each tree felled for its bark, yet no measures were ever taken by the owners of either public or private forests to secure supplies for the future by conservancy or replanting. Meanwhite the consumption of bark in Europe steadily increased, and, as an antiral result, prices rose, and fears began to be consumed to the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the propert

north of Toungoo, and about \$4,000 plants are 'non alive. But the plantation does not thrive so well as could be whyled, and it is desirable that the advice of an expert should be obtained as to the best course to be taken. It was hoped that Dr King would have visited Burns, but as yet he has been unable to do so. If the Government of Bengal can spare him, perhaps he will be able to come in May 1833. At Proon choung the cultivation of Girchona has done so poorly that orders have been given to abandon further outlay on the experiment there. About 300 hot Circhona bask were recently received from Thandoung, and the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the

## RESPECTIVE VALUE OF THE ALKALOIDS

"As has been already explained, the medicinal cystallizable alkaloids contained in the bark are quin ne, cinchondine, qui ndine, and cincho into together with an amorphous alkaloid. A fifth called ariene is occasionally found, but has never been used in medicine. M. Hesse has also recently amounced the existence of another alkaloid occurring only in the succurabra bark grown in Sikkim. This base has received the name of

VALUE OF ALKALOIDS

always been much esteemed and of late years (since it began to get scarce) has brought a price as high or even higher than that got for the barks richer in quinnie "(King)

FEBRIFUGE IIAO

## GOVERNMENT CINCHONA FEBRIFUGE AND QUININE

"It had for many years been suspected that the other alkaloids in which red bark is so rich are nearly, if not quite, as efficacious febrifuges as quinnie. The settlement of this point naturally demanded attention at an early stage of the Cinchona experiment. In order to settle it by actual rinal, Commissions of medical officers of Government were appointed, and the result of an extended series of trials instituted by them may be given in the following estrates from their reports.—

"In regard to the relative effects of the three new alkaloids, and with then chemically pure sulphate of quinne, the evidence derived from their use shows that with the evception of sulphate of cinchonine, as

or newscrients edan tentinensi

power, and in equal circumstances their use produced almost the same

physiological results.

f quinine, and at sulphate of ulphate of cin-

dphate of crecuonine, though considerably interior to the other alkaloids, 19, notwithstanding, a valuable remedial agent in fever.

"There is no longer room to doubt that the alkaloids are capable of being generally used with the best effects in India. They have been compared with quinine, a drug which possesses, more than any other that can be named, the confidence of medical practitioners here; and have been

Nhaife di

other d by

the quinine-maker as good American yellow. The establishment of the therapeutic excellence of these alkaloids largely increased the value of the red bark plantations in India, and made much easier of solution the problem of supplying its fever-stricken population with a cheap and effectual februfuge And for the solution of this problem the Government very speedily took active steps, by appointing Mr. J. Broughton, a skilled chemist educated in England, as Quinologist to the Nilgiri plant-ations Mr. Broughton, after making some valuable observations on the chemistry of hving Cinchonas and initiating a process for extracting the whole of the alkaloids from succirubra bark, retired from the service of Government about 1877 The manufacture of Mr. Broughton's amorphous quining was, however, discontinued on the departure of Mr. Broughton, and since then the whole of the bark produced on the Nilgen plantations has been disposed of by sale. In 1873, Mr. C. H. Wood was appointed Quinologist to the Government plantation in Sikkim, and by him a process of manufacture was indicated by which the mixed alkaloids of red bark are extracted in the form of an amorphous white powder. This powder is called Cinchona Ferriruse, and up to the 31st March 1885, 70,4910 of this drug had been manufactured at the Sikkim plantation. This drug is disposed of only in India, and is

(but not powdered) and is put into wooden casks, where it is macerated in the fold with very dilute hydrochloric acid. The liquor is then run off into wooden vessels and mixed with an excess of a strong solution of caustic soda, a precipitate forms, which is collected on calico filters, and well wash

FEBRIFUGE.

hours the liquor is carefully filtered. The filtrate is mixed with caustic soda, and the resulting precipitate collected on calico and washed with a small quantity of water, direct and powdered it is then ready for issue, and is sent out under the name of Cincinona February."

QUININE.

numne in tellow bark can be extracted in a form undistinguishable, either chemically or physically, from the best brands of European manifacture. This can be done so cheaply that, as long as the supply of bark is kept up, quinne need never cost Government much above twenty-five rupees per pound. It is true that, at the present moment, quinne is obtainable in the open market at rates not very different from this; but that is due to entirely exceptional causes. For some time back the Ceylon planters have been up-rotting their Cinchona trees, both to save them from disease, and to make way for tea-planting which appears now to be becoming the principal industry of that Colony; and Cinchons

# TRADE IN CINCHONA

PRESENT CONDITION OF THE BARK TRADE —Dr King has kindly furnished the following paragraph on this subject —"The present condition C, 1151

## Foreign Trade in Cinchona.

CINCHONA

of the Cinchona bank trade is one of depress on This is by no means due to any diminution of the demand for the Cinchona alkaloids, but in a great measure to the fact that an entirely new source of quinine has of late been discovered in the northern parts of South America. This TRADE.

1152

years been poured into the London market in enormous quantities under the designation of Cuprea bark. The depression is also greatly due to the enormous exports from Ceylon, where cinchona is everywhere being up-rooted to make way for Tea The effect of these flushings has been temporarily to swamp the market, the Cuprea crushing out the more costly Cinchona barks The Cinchona planter, however, has only (if he can afford it) to play a waiting game for, if the importation of Cuprea bark goes on much longer at the present rate, Remija trees will soon become scarce in all easily accessible spots, and the exports from Ceylon must soon diminish With the extension of civilization, and with the increase of wealth in tropical countries, the consumption of quinine must steadily increase, at any rate, as long as malarious fevers continue to exist in these countries

Remija plants have only recently been introduced into India Plants are being grown in the Sikkim plantations, and Mr Lawson alludes to those in the Nilgiri plantations as too young to advance any opinions regarding the success of this new undertaking II is teems probable, however, that it may be found possible to cultivate the Cuprea-bark plant in regions where labour may be less expensive than is the case with the Cinchona plantations Remija purdicana and R pedinculata yield the Cuprea bark of commerce

In the official correspondence regarding Cinchona, various opinions

plantations are not too numerous for profit " It must, however, be admitted ' abando

Colocynthis

Colocynth,

Colocynth is rarely employed alone, it is generally given in combination with other purgatives and carminatures. It commonly causes griping when used alone, in excessive doses it produces inflammation of the intestines and even death. The principal efficient forms for the use of this drug are the compound extract of Colocynth, compound Colocynth pill, and Colocynth and henbane pill. (Bentley and Trim, Much. Pl., 124). From the pulp a watery extract is prepared, which is much.

the supply of the medical

stores in Paujau the fluit is extensively employed as a purgative for horses. The pulp of the fresh frut mixed with warm water, or the dired pulp with agreetin, is reckened a special remedy in cholera. The dired root reduced to powder is given as a purgative (Bellew) Stocks says the root and the junce are both used medicinally in Sind. In a report of the drugs shown at the late Colonial and Indian Exhibition from Baroda, the properties of the fruit and root are given in very nearly the same terms as above, so that the knowledge of this drug seems very extensively diffused over India.

root They are transplanted into a nursery in the grove; here they remain until retransplanted to their destined places in the grove. The system seems defective and the nursery is only once a year weeded, vis., in October Grafting is quite unknown, and no care seems to be spent on the selection of the seed

Pruning.

COLLECTION AND PRUNING -Each collector has a ladder, about 20 Collection and feet long, made of light bamboo A coarse net bag, held open at the mouth by a cane ning, depends on his back by a strap passed over the right shoulder and chest. Into this he throws the oranges and before descending he removes the withered leaves and dead branches, or cuts out boughs injured by the loranthus parasite that does such damage to the plants. "The orange trees receive no other handling than the above, they are never systematically pruned or thinned, and are allowed to retain just what fruit they set, and yet the crop turns out wanting neither in size, flavour, nor abundance. Contrast with this the elaborate summer and winter pruning of the French gardens and the systematic cultivation and

1241

the dogs have come by habit to relish this food

TRANSPORT TO THE PLAINS -The oranges so collected are taken Transport

quarry are some by partiting for rice, fish, &c., to the Munanimanan boatmen at R6 a son, being R4 less than the oranges at the Shalla groves, and yet this includes the cost of cultivation, labour of plucking, and carriage to the river.

II -ORANGES OF NAGRUR IN THE CENTRAL PROVINCES -We have already given several passages that refer to the so-called wild oranges both of Nepal and the Central Provinces It will only be necessary further to give here a brief account from the pen of Mr. J B Fuller, as published by Dr Bonavia, in order to place before the reader a comparative sketch of these groves to complete what has been said of the khásia hills These two lo alities represent the bulk of the orange production of India Mr Fuller says - Within the last twelve years many new orchards have been planted in Nagpur, Kamptee, and other parts of the district, and orange cultivation is now spreading rap dly in other districts of the Provin e. There is a great demand for the Nagpur oranges in Bombay, and considerable quantities of the fruit are annually exported to this and other places. In the year 1885, 22 609 maunds of orange fruit were exported from Nagpur station, out of which 21,400 maunds were exported to Bombay alone

te to repeat that the North-West Pro-Nepal, Delhi, and to some extent also and Burma are practically dependent

Habitat -The Bergamot Orange is cultivated near Reggio in South Calabria, in Sicily, and in the south of France, but it is only rarely met with in India. It may be doubted how far the above vernacular names given to it are correct. The fruit, when full grown, is still unripe and green, they are sometimes known as green oranges. Some of the green oranges met with in India (and already alluded to, p 340) may belong to this variety.

BERGAMOT OIL

Oil -The rind of the fruit yields on expression the oil known under the name Bergamot For this purpose the fruits are used, and one the name of them are said to produce about three ounces of the otto Formerly the oil was extracted by distillation or by expressing the rasped rind, but these processes have been superseded by the écuelle,

Habitat—A native of the islands of the Malay Archipelago, more particularly abundant in the Friendly Isles and Fiji Introduced into India from Java and into the West Indies by Captain Shaddock, hence the name Shaddock. It is cultivated in most tropical countries In India and Burma it is a common fruit tree. It is, however, more frequent in Bengal and Southern India than in the North-West Prov The vernacular name Batavi nebu suggests its having been originally brought from Batavia "The fruit is very large, weighing sometimes ten to twenty pounds, roundish, with a smooth pale-yellow skin, and white or reddish sub acid pulp. When the fruits attain their largest size, they are called pompoleons, or sompilmousses, those of the smallest size form the 'Forbidden fruit' of all the English markets" (Treasury of Botany)

Vern — Bijaura, limbu, kutla, bara nimbu, turanj, nimbu, limu, Hino.

much resemples a small pullicio.

The Citron: The Lemon.

CITRUS Medica.

According to Gallesio it was introduced into Italy about the third or fourth century. The Jews cultivated citron when under the Roman rule, and used the fruit, as at the present day, in the Feast of Tahernacles: each person bringing a citron in his hand. Dr Royle found the species growing wild in the forests of Northern India, and, as already stated, it may therefore fairly be conjectured that the original home of the citron was in India. It has now spread over the whole of the civilised world, and even in cold regions it is cultivated under artificial heat.

Gum -Said to yield scantily an unimportant gum. Sent from Masulipatam to the Madras Exhibition in 1855.

CITRUS The Lemon. Medica. THE LEMON, Eng.; CITRONNIER, LIMONIER, Fr.; LIMONE It.: CITRONE, Germ. Syn. -C. Aurantium, var. Limonum, W. & A Prodr., of: C Limonum. Wall Cat , 6399 : C. MEDICA, Willd. (according to Roxb), Fl Ind , Ed. BURM , Lokka-dehs, SING P. .... and Drugs, in As Res , Vol XI , p 164 Is nightly probable the lemon is of much more recent origin than the citron and the lime The question has been recently raised as to the highest altitude oranges and lemons could be grown in India A writer in the Agn-Horticultural Society's Journal said they could not be grown above 5,000 feet. Madden refers to the lemons grown at Almora, the fruit being collected in summer and ripened in straw. The altitude given above is perhaps correct for the Indian species generally. History.—Dr. Royle is said to have found the tree growing wild in the north of India, and Atkinson reports that Madden spoke of LEMON the jamira or wild variety in and in the Kota D. and V. man wild plants were known De Candolle states that the and Romans, and that its c conquests of the Arabs. On their spreading over the vast regions of Asia and Africa, they ----1. 1. tangets come and the from the lemon. such as p hip joints, &c., Sarangadhara teconomiends the use of temon juice with yarakshara and honey (U, C. Dutt). The best substitute for lemon juice is a solution of about eight drachms

of citric acid in sixteen ounces of water, with the addition of a few drops of lemon oil Lemon juice may also be used in preparing effervescing diaphoretic and diuretic draughts. The relative proportions of lemon juice and citric acid with the alkaline carbonates, for the formation of effervescing draughts, are as follow:-

Lemon juiceor Citric acidto 20 grains of grs xiv Bicarbonate of Potash, Fi dis nes Fl drs vi GLZ XXIA Carbonate of Ammonia, grs. xyn FL des 1v Bicarbonate of Soda.

The lemon juice, being liable to spontaneous decomposition, speedily becomes unfit for medical use. "One of the best methods of preserving the juice is to allow it to stand for a short time after expression, till a congulable matter separates, then to filter, and introduce it into glass bottles, with a stratum of almond oil or other sweet oil on its surface. It will keep still better if the bottles containing the filtered juice be suffered, before being closed, to stand for fifteen minutes in a vessel of boiling water. Another mode is to add one-tenth of alcohol and to filter. The juice may also be preserved by concentrating it either by evaporation with a gentle heat, or by exposure to a freezing temperature, which congeals the watery portion, and leaves the juice much stronger than before." (U S Dispens , 15th Ed , 849 )

Dr. Charles Rice of New York states that the bank of the root has been used in the West Indies as a febrilinge and the seeds as a vermilinge.

VI.-MATERIALS USED FOR GLAZING OR PAINTING POTTERY IN INDIA.

The indigenous art of glazing potters, as practised in India is crude and unsatisfactor, Ball 2435. The variable or imperfect glaze used for the sugar-boilers' pans, known in Bengal as solar, is thus described by Mr. Piddington. There are two kinds of earth used one of which is called beliefs, it is a solicious and otherous earth, the best being fou

use, the p

Uporomi, 20 miles v

Kulna obtained from one maund of the earth, two varieties of the uporoms are

of lime. The black colour of pottery is often obtained from the smoke of ole-abe thrown into the blain when the balany is complete. At other times an organic variash is used for this purpose, except when, as mentioned in connection with Azimgaria, the clay itself contains the necessary organic matter to cause it to burn black. Artificially black need pottery is produced at Monghir, Patna, Sarun, Chunar, and Surat In the younger rocks of the Raymahal series certain clays occur called him. These are used as priments. According to Buchanan the potters of Polymahal use this khars for gring a white surface to pottery made backed, such as that seen at Kota, Lucknow, Benares, kor, at other times it is powdered with mica, or by other mechanical means has a colour imparted to it. Black pottery, so for example, often etched, and a preparation of tim and mercury rubbed into the patterns in imitation of metal body was the strength of the metal and metal to the surface and the sumhar which was the surface to potter mechanical metals has a colour in which we will be surface to the surface and the surface to the surface to the surface to the surface to potter times it is powdered with mica, or by other mechanical means has a colour in both ware. With the exception of these measured he attempts the kinnhar body was a surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the surface to the sur

Habitat - A common weed throughout the greater part of India, ap pearing in the rainy season, very common in Bengal and South India

Oil—The seeds yield a light olive-green coloured limpid oil when subject to a great pressure. It seems likely that this oil would prove serviceable where a very liquid oil is required. The oil could be prepared to any extent.

Medicine—The Jurge of the leaves is poured into the car to relieve earche. According to Rheede, it is useful in deafness Dr Dymock writes that the juice mixed with oil is a popular remedy in Bombay for pursent discharges from the car, whence the Bombay name of the plant Aanphists. "The LEAVES boiled in ghi are applied to recent wounds, and the juice to ulers" (Drury). In Cochin Chinsi the whole plant, brussed,

to relieve ear-ache and as an astringent in cases of atorrheea the ear should be syninged well before its application. (Brigade Surgeon J H Thornton, Monghyr). "Alterative, useful in secondary syphilis and enlargement of the liner and spleen." (Surgeon-Major J McD Houston Travancore, and John Gomes, Eag, Medical Storcheep, Trevandrum). "The seed made into chutney has strong digestive power (Native Doctor Ununguiden, Methapollium, Madras).

"The seeds of Cleame viscosa are anthelmintic, rubefacient, and vestand the leaves rubefacient, vestant, and a useful remedy for a few diseases of the ear. The seeds are valuable in expelling round worms, and ilso as a rubefacient and vestcant in all the compliants in which mustard is used. The leaves are also useful in the same way as a local stimulant, and, in addition to this, the juice possesses a curative influence over some cases of otalgia and ottorfixes, but the smarting it produces in

recording to their age. As a drug the leaves of Cleone viscois are much superior to those of Gymandrogus pentabylla. It is the former which possess a distinct feetid smell and efficient rubefacent and vession properties, and not the latter. The above plants are frequently found growing together and are often confused partly from a general bornian simularity between them, and partly on recount of their native synonyms being almost the same. The close similarity of their seeds addle greatly to this confusion. There will be, however, no difficulty in

#### CLERODENDRON A Mild Antineriodic merme MEDICINE distinguishing the two plants if due attention is paid to the following botanical characters -'Cleome viscos: -Siliqua flat, striated, pubescent, and sessile or short stalked, flowers yellow, stem and branches quite covered with viscid strongly "As the seeds of both of these plants are very similar, I need not de scribe them separately They are as follows small, flat, and slightly acrid or bitterish in taste. They yield a small quantity of fixed oil on expression remedial value' (Honorary Surgeon Moodeen Sheriff, Ahan Bahadur, Triplicine Madris) Food - The SEEDS of Cleome viscosa are much used by the natives, FOOD Seeds chiefly the Brahmins, in their curries, they are sold in all the bazars at a trifling price (Rord) Lisboa says that the PLANT is eaten boiled 1372 Plant with chillies and salt as salad **1373** CLERODENDRON, Linn | Gen Pl , II , 1155 This name alludes to the variable properties of the species kleros, lot, and dendron, a tree [VERBENACEÆ Clerodendron Colebrookianum, Walp , Ft Br Ind , IV , 594, 1374 Vern - Kadungbi LEPCHA Reference,-Gamble, Man Timb 200 Habitat -An evergreen shrub with olivers grey bark, met with in Sikkim and the Ishasia Hills, 2 000 to 6 000 feet also in Burma Food - The young LEAVES are eaten by the Lenchas FOOD 1375 TIMBER Structure of the Wood -Grey, soft C. merme, Garin Il Br Ind . 1V . 586 1376 Syn -VOLKAMERIA INERMIS Linn I377 Vern - Sang-kuppi sang k pi la i jai, HIND Bun jumat, bun joi i bon ti MAR . m ki fpi, i ka eru Pernias Reformen

Habitat - 1 lurge, ramous often scandent evergreen shrub, common in tidal forests in Bengal, Burma, and the Andamans

Perfumery - An exquisite perfume is said to be derived from the flowers of this plant (Presse) Medicine - Dr Dymock says that the PLANT has a reputation as a febrif ige in remittent and intermittent fevers. This fact is supported by

Dr Sakharam Arjun, who, upon the authority of Dr Hojel, states that C. 1379

Habitat.-A pinkish-white-flowered shrub, common in waste places throughout the greater part of India and Burma and in the damp forests of Cevion up to an elevation of 5 000 feet Grows gregariously, forming a dense under vegetation, specially associated with the Bamboo passing into fruit the calvy becomes scarlet, and the plant is then even more attractive than when covered with its foetidly-scented flowers

Medicine - Dr Bholanath Bose calls attention to the LEAVES of this plant as a cheap and efficient substitute for chiretta as a tonic and antiperiodic" (Pharm Ind.) According to Dr. Kanny Lal De, OIE, the fresh surer of the leaves is employed by the natives as a vermifuge, and also as a bitter tonic and febrifuge in malarious fevers, especially in those of children Dr Dymock states that he has not seen the leaves used medicinally in Bombay, but they are bitter Dr Honigberger men tions the use of the BARK in medicine by the Arabian and the Indian physicians

Special Opmons - 6' The expressed juice is an excellent lixative, cholagogue and anthelmintic It is used as an injection into the rectum in cases of ascarides It is also a valuable bitter tonic, and the natives believe that its presence cures scabies in the locality" (Brigade Surgeon J H Thornton BA, MB, Monghir) "Is said to be a very useful antiperiod c" (Surgeon Major E Sanders Chittigong) "The juice of MEDICINE. DYE. Seeds

1404 MEDICINE Root. 1405 Habitat.—A common garden flower, also occurs in every hedge-row all over India The seeds were first taken to England from the Island of Ternate, one of the Moluccas, hence the specific (and former generic) name of the plant.

Dre—Bidie remarks that the SEEDS are said to be used by dyers
"The corollas of the blue variety are said to afford a blue dye in Cochin
China, but it is not permanent; and Rumphius says that they are used for
colouring boiled tice in Amboyna" (Treasury of Botany)

Medicine.—The ROOT is a powerful cathartic like jalap, and has been recommended to be used along with other lavatives and diureties in ascites and enlargements of the abdominal viscera (Dymock). Ainsile recommends it in croup as an emetic, but O'Shauethnessy, in Bengal Dispensa

Seeds. I406 as a duretic, and in some cases as a layative. The speps are, however, more useful, and have gained a certain reputation in Europe as a safe medicine, especially for children. valuable deposit of coal occurs (See Manual of the Geology of India.

#### INDIAN MINES

Dr Walter Saise Manager, E. I. R. Company's Collieries, has obligingly furn shed the following note on Coal and Coal mining in Ind. a which. it may here be remarked, is based on the results of 1883 81 but on returns some of which are not access ble to Government. This explanation accounts for the apparent discrepancies between the returns of production and consumption published by Government for that year and the figures here given by Dr Saise On a further page will be found more recent figures abstracted from Government returns which bring this brief note on Ind an coal up to present date -

INDIAN CONSUMPTION OF COAL - The coal and coke used in India are e ther imported or raised and made in the country. The foreign sources of coal and coke supply are Europe, Australia and Africa Tak ng coal first, the proportion of coal raised in the country and that imported is as under-

Imported (1883 84) Raised in India (1884) about

678 000 1 556 400

2,216 000

The value of the former is stated to be R1 09,96 047 The value of

COAL Coal and Coal-mining in India
to a smaller extent. The small kinds of rubble or smithy are used in

1433

"Below is a table of ultimate analyses of specimens from Karharbari and Raniganj coal-fields with analysis of English and Welsh coals for comparison —

COAL FIELD	Carbon	Hydrogen	Oxygen and Nitrogen	Sulphur	Ash	
Karharbari . E I Railway Ranganj (N. B Coal ) Co)	78 20 70 93 74 31	4 34 4 10 5 12	7 89 12 49 9 67	0 42 0 52 0 47	9 15 11 96 10 43	Main Seara Upper Seam
England {Newcastle South Wales	82 83 88 47	5 32 4 59	7 13 3 02	1 17 1 25	3 55 3 69	

"It will be noticed that in several particulars Indian coal is inferior to English, 1st, in containing more ash, and 2nd, less carbon and hydrogen

"In the table below the commercial analyses of many Indian coals b I the writer and Mr T H Ward, F G S, are given, as also commercial analyses of Newcastle and Welsh coals, for comparison—

Coal-fifld	Spec gravity	Ash	Fixed carbon	Volatile matter	Sulphur	Heating power by Thomson's caforimeter	Remarks.
Karhar  Tindaria  Central  (1835)		ı		. 1		13 20 12 50 12 89 13 89 12 35 12 40	Not worked Not worked
Welsh Newcastle	1 312	3 68 3 49	82 66 63 25	13 66 33 26	1 59 1 07		

"The above table shows that there is great diversity in the chemistry of the coals of India, and the variations in physical features are just as marked With the exception of Tindaria and Assam coal, all Indian coals are remarkably laminated in structure, the laminæ consisting of a dark highly

							-	٠.	
								1	.595,200

As the newer fields develop this estimate will have to be increased

DISTRIBUTION OF INDIAN SUPPLY —"The Warora coal-field is connected with the Nagpur branch of the Great Indian Pennisula by the Wardha Coal State Railway, the Mohpan (Narbada) coal-field by a branch from Gadawara with the Great Indian Pennisular The Umaria coal-field has been tapped by the new line from Kutin through the East Indian Railwas, Jubbulpur line The Assam coal field is connected

the fol-Wardha

"The Bengal coal finds its way to the Panjab railways and the railways of Bengal, as also irto the manufactories of Calcutta and the large cities along the line of railway. Some is used in the steam ship lines Small coal is largely employed for brick making. Comparatively little is utilized for domestic purposes. The Collery Companies should endeavour to create a want by teaching the people how to use small coal in large towns, such as Allahabad instead of wood and condung. Agencies like those in English cities could probably do this in a few years, and the large waste of small coal that goes on at present would thus be obviated.

#### MINING IN INDIA.

"Has made considerable progress during the past few years, machinery and well-appointed heapsteads and pit frames are coming generally into use

which is 402 feet deep

"The system of working varies very much At Warora, Central Provinces, where 100,000 tons per annum is wound by direct acting engines out of two shrifts 200 feet deep, the system most nearly approaches the

 It may be noted that it is the marketable coal that appears in the Government returns, not the actual amounts raised in 1803-84 these were 1,200,957 tons Conf. with p 355 - Ed

C. 1435

in height, leaving the roof coal, and pillars 40 feet square. The coal is so hard, it has to be nicked and undercut and then blasted down. The pillars are worked by splitting each from one headway to another and then taking the far end off in slices. The roof coal comes with it

"At the Molipani collieries a similar system is worked. The difficulties met with in these mines, owing to the faulted and disturbed nature of strata, are probably unequalfed in India.

Karharbiri coal-field - Is the smallest field in Bengal It is mainly worked by three Compan

gal Coal Company, and 1

nected with the main line worked by locomotives

a scene of great activity. As much as 50,000 tons of coal and coke have been raised and despatched in one month. The coal field is connected with the East Indian Railway. Chord line by a branch from Madhupur to Girdi, the terminus or collery station. In mechanical arrangements for raising coal, this coal field is well advanced. The old fashioned gin is almost obsolete and bullock-carts have thitle to do

"The system here is similar to that obtaining all over Bengal The

and make are now universal, the crowbar and single pick having been outsel. The workings are on the bord and pillar system. Pillars wany from 12 feet to 40 feet square and 40 feet X60 feet. In the shallow mires and thin scams (7 to 8 feet) the former size obtains, in the thick seams (from 12 to 20 feet thick) the littler. Pillins are worked in the 8 feet seam in the following manner. A 4 feet chock is placed between each pillar in the row of pillars (generally six in number) that are to come out. A chock is also placed in from to feach pillar. The pillins is the attacked from the from side. When pillars are taken out the chocks are withdrawn and the roof falls.

the Bauris are not in such requisition as formerly

"Drainage is effectively carried out by Tangye's special and lifting and forcing pumps, worked by bob levers from horizontal engines. The machinery is of good type, and winding and hauling are done by good engines

"Ventilation is attended to in the deep mines, mainly by furnaces or steam jets

1436

COAL. Coal and coal-mining in India. "The miners live in small villages, aggregations of huts of mud walls of bricks set in mud with thatched or tiled roof. The huts consist of one room, sometimes two, of from 6'x6' to 10'x 10' in size Those better off have consheds and granaries, these two latter with the dwelling forming three sides of a quadrangle. The larger proportion of the labourers cultivate during the rainy season and work at the collieries only in the cold and hot season, say from October to June. Some of the labourers have "The following notes on the Ranigani coal-field are by Mr T. H. Ward -' f 's and 1437 nch rise. nes. which they sang as they tramp round and round "The sinking in the district is easy, through sound sandstones, no brickwork being required to protect the sides. Heavy water is sometimes met with "The coal in the east of the field is very strong and non-caking The sandstone roof is also very strong and comes right down into the coal Practically no timber is required in working the coal in the manner described below. In the west of the field at Sanktoria, for instance, the coal -1 41 - 1 harn the came From Belroie, or coals netimes reach 'rdohi colliery of the Barabeen found. The ignorant native has not yet recognised that his health and longevity is in question, and he has besides helped much to prevent ventilation becoming a necessity by the wonderful power of endurance he has shown This power of endurance enables limit to work for hours at the bottom of a sinking shaft with water pouring over his naked body or to work all

1438

India employs about 30,000 persons, the quantity of coal raised per annum

per person employed, surface and underground, being 51 tons-"In Europe the numbers are different, varying with the thickness of seams and nature of difficulties met with:

England (average) . 348 tons per person employed under-

Belgium . 134 Ditto Ditto.

Saarbruckin . 187 Ditto Ditto

There is no Government regulation of the coal industry; any person can manage a mine on any system he likes, whether or not he has experience or training. Interest has a great deal with the appointment of the managing staff, and it is to be feared that the best is not made of the splendid coal deposits, the favourable roof, and the moderate depths and inclinations of the seams.

Assam has since increased its output, the figures for 1886-87 being returned at 72,000 tons. It is stated in the Railway Administration Report for 1886-87 that—

"Coal continues to enjoy the confidence of the public. Its sale to

for by the Dacca State Ra Iway, the Eastern Bengal State Railw It is being largely enquired for b Calcutta, also by the Eastern I

been found suitable to the engines and the Northern Bengal State Ra iway, but the chimany of access to these two railways from the river Brahmaputra prevents its extensive use by their administrations. The coal continues dusty, though it is being mined deep in the hill sides. But its nature is beginning to be understood, and its frability is not found to be a drawback to its use as

a steam fuel

"The coke is found to be saleable to the tea factories of Lakhimpur to
an extent of about 3 000 tons per annum The Company is preparing by
means of an increased labour force to enlarge the output of coal to 100,000

tons yearly" Colleries have recently been opened out at Dandot (Panyáb) and Singarem (Nizam's Territory) The coal in these mines has been pronounced of good quality, and in Upper Burma coal has been found in the Kali Valley on the Chindsin Riverly, but arrangements have not as

The commencement of this industry appears to date back to tace, when a mine was opened in the Ranganj district in Bengal. For twenty years no new mine seems to have been opened, and then only three mines were opened down to 1854. In that year the commencement of the East Ind an Railway line which was laid to run through the coal bearing tree one of the Dand do her.

In the paragraph above the number of mines in 1886-87 is stated to

COBALT.

### Source of Cobalt.

This substance is generally known as Cobaline. In the Riphilina Garetter, and in the Jury Reports of the Exhibition of 1862, occur accounts of the Jeypu enamels, but in accent publication, Dr. T. H. Hendley (Journal of Indian Art), gives from precise details. Six George Burdwood in his Indiantal Arts of Indian under Enamels, [19,221 167—165] and also under Portery (1922 301—324), gives most instructive particular forms.

scribed Cobalitie, in the Records of the Geological D-partment, seem to be unarimous in their op non that Cobalt is only rarely met with in India, and that, too, in the mines of Rajputana alone (as Iar as petursular India is concerned), and that the ox de is artificially prepared; in other words, that it does not occur naturally in Central and Soilfern Irdia;

1446

will be found some account of the uses of cobalt in the ceramic industry while

ces-

Dr

Hendley says that the colours used by the Jeypore enameliers "are obbained in opaque's treous masses from Lahore, where they are prepared by Muhammadan nambari or bracelet makers. The based can be a state that they cannot raske the colours themselves. The based can be colour is vitreous and the colouring matter is the oxide of a metal sorth as cobalt or from Large quantities of cobalt are ob anned from Bhacre near Khetni, the chi dison of a tributary State of Jeypore, and are used in producing the beautiful blue ename!" In these passages Dr Hendley does not make it qui e clara whether the Jeypore enamiclers grepare their own marrial for the blue colour, though unable to prepare the other colours, or whether the enter russ of the crude matternal is conveyed to Lahore and other centres to be prepared and returned in its manular colours.

cusses the Mültán enamel industry and furnishes particulars regard 2, the Mira blav vitrous ename! In the Multin Gard'eer (r. 102) this subject is enlarged upon, and re'erence is also made to the Bahavalour enamels, where, in addition to opaques, a semi-translucert sea green and also a dark blue are produced.

In Europe Cobalt is largely used as a pigment and to colour ordinary glass

Habitat.—The Cochineal insect was first discovered by the Spaniards in Mexico in the year 1518, but it was not made known to Europe until 1523. At first it was supposed to be a seed, but in 1703 Leeuwenhock showed it to be an insect. In Mexico it is particularly abundant in the provinces of Oaxaca and Guerrero. It occurs in many localities in Central America, and for long has been one of the most important articles of export from Guatemials, but it is met with also in South America, and recently it has been found (or perhaps only an allied insect) in the West Indies and in the southern portions of the United States.

HISTORY.

HISTORY AND INTRODUCTION—The immense importance of the trade, carly established in this insect, led to efforts for its propagation in other countries, and for many years this has been profitably prosecuted in Tenerifle, the Canary Islands, Java, Algeria, and to some extention in Spain According to some writers the best quality now comes from Honduras. The attention of the Court of Directors of the East India Company was directed to this subject by Dr. James Anderson of Madras in 1766. He forwarded to Sir Joseph Banks samples of a dye-yielding insect which was proved to be a species of Coccus, but not Coclineal

species of Cactus or Opuntia. On the China and Manilla species of the North and even on that from Kew, the survivors began to die fast. It forth

coccus cacti.	The Cochineal Insect.
HISTORY.	to the discovery of America, and therefore no Cactus can be called indigenous to India. This is more than a quibble as to the correct usage of a scientific term. If the Coccas sent to Sir Joseph Banks, one hundred years ago, was found feeding on a Cactus, it must be regarded as but an earlier introduction than the Cochineal brought to India by Oaptain Nelison. It therefore seems probable that the Portuguese (or whoever introduced the Opuntal) may have intentionally or unintentionally brought the Cactus-feeding Coccus also. In 1843 Dr. Dempster addressed a letter to the Governor General of India which alternards appeared in the Journal of the Agri. Hotticultural Society. He there eviols the superior quality of the dye obtained from 'the native" or 'indigenous' insect as compared with the imported. "The quality,' he says, "of native Cochineal which I found capable of dyeing a certain weight of woollen cloth proves that the indigenous insects contain an

1465 Grana sylves- tris 1466	Supp. 40) GRAMA FINA AND GRAMA SYLVESTRIS—Humboldt was, perhaps, the carliest observer to distinguish "the fine from the safetater or wild sort of cochineal". The former insect, he says, is meally, or covered with article powder, while the latter is enveloped in a thick cottony substance which prevents the rings of the insect being seen. The Grama fina is more to be a native of Microca, and the Grama sylvestris of Solvandard or Baffour remarks. "It has been mentioned that at As the coch

fostered in anticipation of the arrival of a fresh importation. Degenera-tion, if established, might be accounted for by an originally semi-domes-ticated creature having been allowed to run wild for a century or more, or from having been forced to feed on the wrong plant. Mistakes may thus be made, but the course indicated would most probably prove the most direct, and it may happen that we possess a long-acclimatised stock which, under careful treatment, would prove more hopeful than any insect that might now be introduced

with 2 per cent of bichromate of potash and ayed in a separate bath receives a good purple, the colour being darkened by the addition of sulphure acid to the mordant Mr Hummel gives particulars of the dying for crimson or scalet! Wool to be dyed the former colour is mordanted with aluminum sulphate and tartar, the dyeing being effected in a separate bath There are other methods, but the above is perhaps the best Lime-salls are not beneficial. The latter shade is produced by the acid of stannows salt and cream of tartar or ovalic acid. The mordanting mry be performed separately or along with the cochineal.

Slik d<sub>yelng</sub> 1484

For sife the mordant is aloun, to be worked into the fabric for half and house and steeped overnight. The fabric is then washed and dried and dyed in a separate bath. This gives the crimson. For the scarlet, after boiling and washing the sife is first grounded with a light yellow produced with scap and arnatio and thereafter washed. For darker shades soap should not be used. In both cases the fabric should be mordanted by the same process as described or the crimson, only using intro-murate of time in place of alum. By the aid of iron mordants fine shades of lilac may be obtained.

#### COCHINFAL AS A MEDICINE

Medicine.—Cochineal is used mainly as an agent for colouring drugs, but it is supposed by some to possess anti-spasmodic and anodyne pro-

MEDICINE 1486

perties Chemical Composition -As far as has been determined, cochineal and lac owe their tinctorial properties to an acid apparently identical in character This is formed within the body of the female insect The chemical examination of this substance has revealed somewhat conflicting results-a fact which has led certain writers to presume that its composition varies Pelletier and Caventon isolated the acid from cochineal and called it carmine, a nitrogenous compound which they expressed by the formula CaHiaNOs. Subsequent observers (Arppe, Warren de la Rue, Hugo Muller, &c ) showed it to be an acid, and found that, in a perfectly pure state, it does not cortain nitrogen, though accompanied by nitrogenous matter which it is difficult to separate from it John named the colouring principle cochinilin. The acid of the authors named has been expressed as  $C_1H_1O_p$ , but the crystalline carmina and isolated by Dr Schützenberger is given as  $C_1H_2O_p$ , the same substance being expressed by Dr Schaller as  $C_2H_2O_p$ . Most recent writers give its formula as  $C_{11}$ . H<sub>1</sub>,O<sub>10</sub> (Crooker) It may be separated from cochineal by precipiting its aqueous extract with plumbic acetate and decomposing the washed pre-cipitate with sulphume and The solution thus obtained is alternately precip tated, and the precipitate decomposed, a second and a third time in a similar manner, employing, however, hydric sulphide to effect the final decomposition. The filtered solution is evaporated to dryness, the residue dissolved in alcohol, and the crystalline nodules of carminic acid

obtained on allowing this solution to evaporate treated with water (Itiller, Elements of Chemistry, P. III, 690). This same substance has been found in the floare sof Monarda didyma and probably in other plants. Pure carmine acid is a purphish-red substance, which, when reduced to a very fine powder, is bright red. Its crystals taste decidedly acid, it is very soluble in hereted to 136° and for the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar of the floar

treating the residue with successive portions of boding alcohol, which on cooling deposits a part of the carmine and and yields the remainder by

solution unless some animonia be next added, when carmine lake is thrown down. Neutral alkaline salts turn carminic acid to violet, while the acid salts of alkalines (bitartrate of potash, for example) render the shade more of an orange.

The chemical history of the carminates is, however, incomplete. The alkaline carminates are soluble, the others, as far as has been ascertained, are amorphous substances. The different results obtained with cochined

DESCRIPTION AND MODE OF GROWTH -Lac is the resinous incrustration formed on the bark of the twigs through the action of the lac insect When the larvæ or grubs of the Coccus lacca escape from their eggs they crawl about in search of fresh sappy tw gs When satisfied, they become fixed and form a sort of cocoon by excreting a resinous substance The male cocoon is own of in shape, the female circular For about 23 months the insects remain within their cocoons in the lethargic state but 1402

it at once commences to crawl over the females. The impregnated female after depositing her eggs below her body, commences to construct cells round each with as much precision as the bee forms its comb

the resinous excretion-lac-which it encrusts around itself. As time advances further changes are visible, the body of the female enlarges considerably and becomes brilliantly coloured. The red colour is due to the formation of a substance intended as food for the offspring. The eggs germinate below, and the large, eating their may through the body of the mother, make their escape to repeat this strange history.

smell on crushing the lac. The writer was once informed by a merchant that his firm in the usual course of histoness imported very largely resin which he believed was used up by the native dealers in adulterating the lac which they and other merchants exported. The gentleman in ouestion condemned strongly the process of adulteration, but justly remarked that resin was an ordinary article of trade used for other purposes which if they discontinued to import would only be more largely imported by other firms

Uses or Lac -In India lac is dissolved in native spirits and coloured. in this form it is used as a varnish for carpentry and furniture, mixed with sulphur and some colouring agent, it is formed into the sticks batts like scaling wax, which are used by the toy makers to coat their wooden wares. In Europe it is largely made into sealing wax and dissolved in spirits. it forms shirit narnish. It is made into cement and into lithographers ink, and is used to stiffen hats and other articles constructed of felt

FIBRE. Floss 1514 Fibre.—The seeds possess a short but very soft and elastic floss, from which fact the plant has received its specific name. This floss is much too short to be of any service as a textle fibre, but, with the flosses gone flower than the standard control of the flosses gone flower than been classed as a "silk cotton". By some writers these have recently been designated "kapok fibres," but there is every reason to believe that the true kapok of the Dutch upholsterers is the floss of Enddendron anfractuosum (see Vol. I. B. 611). In some parts of India the floss of this tree is collected and used for stuffing pillows, for which purpose it would seem better suited than the floss from Bombax malabaricum, as it is not so liable to get matted. It might be found serviceable as a gun-cotton. (Conf. with C. 175 and Kapok in a further volume)

Bark 1515

The Rev A Campbell states that the Santals prepare a good, useful coadge fibre from the bark of the tree In the report of the Conference held on Indian fibres, at the late Colonial and Indian Exhibition, it is stated that Mr Campbell's fibres from this tree were much admired, the floss being viewed as possessing the ment of elasticity—a ment which

MEDICINE. Gum 1517 Floss. 1518 Medicine—The gum has the properties in a mild degree of Tragacanth, for which it is proposed by Moodeen Sheriff and others as a substitute. It is also used as a mild demuleent in coughs. The fines has been recommended as admirably suited for padding bandages, splints, &c, being soft and cool. On this account it has been suggested as suitable for pillows and cushions used in hospitals, &c. Irvine (Mal Med., Patha, p. 78) says the dired leaves and flowers are used as stimu-

geographical and physical conditions were different from those of our day."				
CULTIVATION OF THE COCOA-NUT.	CULTIVA-			
It is commonly reported that there are in India 480,000 acres under the ecoca-nut. A number of passages from Indian authors will be found scattered through the present account of the palm, which every now and again recur to the question of its cultivation. It may, however, be destrable to give here a brief abstract of the opinions published by the better known European writers, since from these may be gathered the results				
of scientific experiments.  Sowing —Ripe nuts, carefully collected, should alone be employed as seed, and for this purpose they are usually gathered from February to May. Seed from very young or very old trees should be avoided. After	Sowing 1522			

Inducts of their surface typosed. Asires, or asires and sur, should be freely placed in the trenches, these act both as a manure and as a preventative against insects. The seed-bed thus prepared should be kept mosts, but not sorked. The germinated seeds may be transplanted when they are in their second to their such or even twelfith month. In the Godavari district they are placed in their permanent positions when there to four years old. In damp localities the transplanting may be done in the hot

deep microity sons these pits should be micro with saind. In matchy land, walls should be constructed around them. Ashes are often recommended to be freely micro with the prepared soil to be put into the pits, as thus is upposed to prevent the attacks of the beeles that prove so destructive to the trees. Cultivation of turneric, arrow rote, &c, in the pits, along with the cocca-nuts is believed to be beneficial. The soil round the seedings is also often kept damp by a bed of leaves, particularly such as will not en-

rains, the soil being replaced and levelled about the close of the rains. By the fourth year the stem begins to appear and has about 12 leaves; it is distinctly visible by the fifth year, when the tree has about 24 leaves. The spathes commence to be formed by the sixth year, and the stem is then 1 to 2 feet above the ground, but in exceptionally favourable chamtes

in the garden is set apart for growing seed-nuts. The nuts take from

If the nuts are left to drop from the tree, which is the usual practice in Bassein, they are either kept in the house for some time and then left to sprout in a well, or they are buried immediately after they have fallen. When the nuts are ready for planting they are buried either enterly or from one half to two thirds in sweet land, generally from 1 to 2 feet apart, and sometimes as close as 9 mebes. A little grass, rice-straw, or dry plantan leaves are spread over the nuts to shade them. If white ants get at the nuts the grass is taken away, and some salt or saltish mud mixed with wood ashes and a second layer of earth is lad over the nuts. Nuts are sometimes planted as late as August (Shréwan), but he regular essaon is from March to May (Chautra and Venthékh), when, unless the ground is damp and their inner mosture is enough for their mourishment, the nuts want watering every second or third day unit rain falls. The nuts begin to sprout from four to six months after they are planted, and

the ditch round the tree, 22 pounds (4 philis) of powdered dry I

#### ENEMIFS TO THE COCCA-NUT.

It is commonly stated that if the soil be too rich a large grub with a reddish-brown head soon finds its way to the roots and into the stem This eats its way through the tissues until the leaves turn yellow, the terminal bud withers, and the tree is killed. This appears to be the beetle known as Butcera rubus. "In the Straits of Malacca, the chief natural enems of the tree is a species of elephant-beetle, which begins by nibbling the leaves into the shape of a fan, it then perforates the central pithy fibre, so that the leaf snaps off, and lastly, it descends into the folds of the upper shoot, where it bores itself a nest, and, if not speedily extracted or killed, soon destroys the tree. A similar kind of beetle is known on the Coromandel coast, and is extracted by means of a long iron needle or probe, having a barb like that of a fish-hook. By using this and by pouring salt or brine on the top of the tree, so as to

-340	The stem of this well-known tree is in Taheiti said to jield gum. It forms large stalactive masses, red-brown, transluent or transparent (Sponst Encycl) Cooke, in his report on Gum and Gum-resins, says that this gum was sent to the Madras Evhibition of 1855 from Transancre. No other author appears to allude to this gum however, and it therefore, seems probable that if produced it is met with only in certain localities. The writer cannot recollect ever having seen a gum adhering to the stems of the palm.
DYE	DYE
1547	"In a patent obtained by Mr. J. H Baker (No 5139, March 20th 1825) the whole or every part of this tree is claimed as a dye-ware, especially the hisk enclosing the fruit, and the foot-stalks of the leaves, the dye was to be extracted by water, cold or binling, or by solutions of lime, potath, ammonia, Ac, and was to serve for dyeing nankeens, blueblacks, &c. The infusion was likewise to serve as a substitute for nutgalls in Turkey-red dyeing. The material does not appear eit to have come into practical use." (Croakes.) #### The Cocoa-nut Palm Cour Fibre.

PROPERTIES COIR.

If cut earl er than this, the fibre is weak, if later it becomes coarse and hard, requires a longer soaking, and is more difficult to manufacture" Dr Buchanan Hamilton in his journey across Mysore states (1, 155) the green cocoa nuts are sold for their husks, from which fibre is extracted, but the husks of the tipe cocos-nuts are commonly burnt for fuel (11, 50) At the same time immense quantities of apparently ripe cocoa nuts, in husk are sent to Europe, the cort from the bush being there separated, cleaned, and manufactured Mr Jackson of Ken, in the Planters' Gardie, describing a visit to Messrs. Chubb, Round & Co's factors, gives an interesting account of the process of husking there pursued. He says "The enormous heap of husks-which, indred is known in the locality

all the nuts are imported in the husk or outer covering, from which, on arrival, they are stripped by men using two fine-pointed steel chisel, and who, by constant practice, become so skilful in the art that many are able to open 1,000 to 1,200 nuts per day. The nuts themselves after being removed from the husks are generally sold to wholesale fruit dealers, who, in turn, supply the the above passage Mr . India is not new ideas furnish cocoa nuts to Eng cocoa nuts is actually use .

Honduras), all round the coast of America and the Fin Island

England attained a vast r apparently having been kept for years on the nut. These facts open up a new field of trade of which with a little assistance the Nicobar and Laccadive Islands in ght profitably and without fear of any rival hope to enjoy a large share

PARATION

Separation of Coir in India .- "The removal of the fibre from the shell is effected by forcing the nut upon a pointed implement stuck into the ground, in this way a man can clean 1,000 nuts a day The fibrous husks are next submitted to a soaking, which is variously conducted. In some places they are placed in pits of salt or brackish water, for 6 to 18 months in other places fresh water is used, but it becomes foul and injures the colour of the fibre. The ch el point to be considered is the duration of the soaking, if it be continued too long, the fibre will be weakened, if it be curtailed, the subsequent extraction and cleans ng of the fibre will be rendered more difficult. The most approved plan of conducting the soaks ing is in tanks of stone, brick, iron, or wood, steam is admitted to warm the water. By this means the operation is rendered very much shorter,

1556

SEPARATION

COCOS The Cocoa nut Palm Coir Fibre. nucifera

cellular substance is separated from the fibrous portion. When on te clean it is arranged into a loose roving preparatory to being twisted, which is done between the palms of the hands in a very ingemous way, so as to produce a yarn of two strands at once"

"As the husk gets hard and woody if the fruit is allowed to become quite ripe, the proper time for cutting it is about the tenth month. If cut before this, the coir is weak, if later, it becomes coarse and hard, and more difficult to twist, and requires to be longer in the soaking pit, and thus becomes darker in colour When cut, the husk is severed from the nut and thrown into soaking pits These, in some of the islands, are merely holes in the sand, just within the influence of the salt water Here they lie buried for a year, and are kept down by heaps of stones thrown over them to protect them from the ripple. In others, the soaking pits are fresh water tanks behind the crest of coral. In these, the water, not being changed becomes foul and dark coloured, which affects the colour of the corr When thoroughly soaked, the fibrous parts are - it taken out of the pits too

ies, if left in too long, the with that soaked in fresh

In the Maldives (neighvernor of Ceylon) cocoa-

nuts are very plentiful, and enormous quantities of both the nut and the fibre are exported to India and Ceylon (See the further paragraph on trade in nuts)

PRICE 1561

Mangalore candy of 560fb will thus be the produce of 5,600 nuts, and should contain about 20,000 fithoms of yarn. The actual price of corr received by the islanders is about R13 per candy. The value of the coir produce of a tree is calculated to be from 2 to 25 annas, and that of the produce of 100 trees from R13 to 15" "The average value of the total raw produce of a tree bearing fruit would then be seven annas to half a tupee, and that of a plot of 100 trees, R45" For the nuts which they export to the Malabar coast they get from R7 to 10 per thousand, or rather 1,100, as 10 per cent is always allowed for luck in these sales The islanders export from 300,000 to 400,000 nuts annually The natives bring their coir to the c

into the Government go for at the rate of R21-1

candy of 610B After t Since then the average price paid for a Mangalore candy of Ameendevy and Kadamat corr has been R20-2-0 (or R23 per Calicut candy of 640 lb) But for the Riltan and Chetlat coirs, which are the best, an average of R20-12-7 or R23-12-0 per Calicut candy is paid A D 1825-26, the Bombay and Bengal Governments took almost the whole of the corr brought from these islands, and credited the Mangalore Collectorate with R25 per candy. The price has since fallen very much It has been frequently below the price during the last twenty years paid to the islanders, and at best has never yielded above 12 to 20 per cent profit The average imports of coir have been from 500 to 600 candies Mr Morris, in his account of the Godavery district, Madras, gives the following brief statement regarding the production and yield of coir -

"The cocoa-nut tree yields an excellent fibre The quantity of fibre

Dist 70)

Spons' Encyclopadia gives the London prices of coir as "Cochin-good to fine, £19 to £25 a ton, coarse, £16-10s to £19-15s Yarn-good to fine, £26-10s to £46 a ton, medium, £21-5s to £28-10s, common, L14 to £22 10s , roping, £18 to £21"

USES OF 1562

1563

#### USES OF COIR

"The fibrous husk of the cocoa-nut is not its least valuable product, and gives rise to a very large trade, both in the East and in Europe At first it was only used in this country (England) for stuffing mattresses and cushions, but its applications have been enlarged and its value greatly increased by mechanical processes, and in a small pamphlet issued by Mr Treloar, more than twenty years ago, he stated that its natural capabilities having been brought out, coir has been found suited for the production of a variety of articles of great utility and elegance of workmanship—table-mats, fancy baskets, and bonnets, &c. Instead of being formed into rough cordage only, and mais made by

facturers, are only a few of the varied purposes to which the fibrous coating of the coccoa-init is now applied." (Simmonds, Troph, Agri, 24). The uses of coir are of course so varied and extensive that it is scarcely necessary to enter upon them in greater detail than indicated in the above passage. To the natures of India it is invaluable as lasting in a damp climate. It is accordingly universally employed in tying the bamboos used in the construction of their buts.	1564
FIBROUS SHATHS OF THE LEAVES AND COCOA-NUT COTTON.—A brief reference has been made to these in an early part of this article. The finer ones are used as filters and seves, but the coarser are apparently put to no purpose, although they have been proposed as suitable for papermaking. They might be used to strengthen saddlery, and even for ladies' corsets and splints. Knox 5135 of Ceylon that "the filaments at the	Sheaths. 1565

flabelliforms (B 680) This is sometimes collected and used by the natives to stop bleeding from wounds. A good sample of it was shown at the Colonial and Indian Exhibition

CADIANS —" The leaves are platted into mats and screens and also made into baskets, and combs are said to be made of the midrib of the leaflets in the Friendly Islands. In the Laccadive Islands mats are made of the coco

boats" ' The Singa neatly, so as to make

OIL.

which, on being boiled until all the water has evaporited, produces a clear edible oil. Only just sufficient water to moisten the pulp should be added, as a larger proportion prolongs the operation and deteriorates the product. When fresh prepared, this oil is compriatively free from smell, but speedily acquires an unpleasant odour; mny attempts have been made to divest the oil of this smell, which renders it inapplicable for the perfumer's use, but only with partial success? "Nearly every writer describes a different mode of preparing the oil obtained by the lot most process. The reader is referred to a further page where this subject will be found to be dealt with under the head of The Oil as a Medicine.

.

pose or other

In the Jury Reports of the Madras Exhibition interesting information regarding the extraction and yield of occoanut oil has been recorded "Half a hundredweight of the dred kernel is a charge for a full-size checke" (or country mortar-like oil-mill), "and a pair of stout well-fed bullocks will get through four such charges in a day, so that twenty mills are required to get through but one in the twenty-four hours. The man who drives has usually a boy to assist him in taking the oil, which is got

#### COPRA OR DRIED KERNEL

COPRA 1587

A very imperfect idea of the supply and demand for this oil would, however, be conveyed were we to omit to examine in this place the trade in copra or dried kernel, the substance from which the oil is expressed. This is largely exported to foreign countries and sent from one province of India to another to be locally made into oil.

1.134.821, and East Africa 627,346. Of these imports Bengal took 8,430,229, valued at R1,75,552, Burma 5,618,949, valued at R3,72,702, Bombay and Madras each received 700,000, and Sind 86,800 Bengal exported no cocoa-nuts to foreign countries, but Bombay and Madras each sent about 150,000 to Egypt, Arabia, and Turkey in Asia. The foreign trade in ripe cocoa-nuts is therefore very unimportant, and but for the Maldives being viewed as foreign territory (while the Laccadives and Nicobar Islands are not), it would be scarcely worthy of notice. It is noteworthy that India at present takes practically no part in meeting the

TRADE IN NUTS

PALM	CHCIP
PALM	SUGAR

#### The Cocoa-put Palm: Sugar.

#### PALM STIGAR

Instead of being fermented, the liquor may be evaporated down and its sugar thus extracted "Eight gallons of sweet toddy, boiled over a slow fire, yield 2 gallons of a lusciously-sweet liquid, which is called jaggery or sugar-nater, which quantity being again boiled, the coarse brown sugar called jaggery; is produced. The lumps of this are separately tied up in dried banana leaves? (Rojle) Dr Shortt says. "The sap is poured into large pots over an oven, beneath which a strong wood-fire is kept burning, the dead fronds and other refuse of the plants being used as fuel The sap soon assumes a dark brown semi-viscid mass, well known as

pots or pan

jaggery. th state it is som to appare contractors, sugar reports, or merchants. 110 sugar refined comprises several sorts, known in the market as moist, raw, coarse, and fine sugar The jaggery is placed in baskets and allowed to drain, the watery portion or molasses dropping into a pan placed below. This is repeated, so that the jaggery or sugar becomes comparatively white and free from molasses. This sugar—for soit may now be called is put out to dry, and the lumps broken up, when dry it is termed raw sugar, and weighs about 25 per cent of the whole mass, the rest of it being collected in the form of molasses" Thus cocoa nut sugar is chiefly met with in the form of jaggery. It is well known, however, that it is capable of being refined according to European principles, and a certain amount of cocoa-nut sugar is regularly prepared "The success of Dr J N Fonseca (author of the History of Goa), in converting toddy of the cocoa-nut tree into crystallized sugar, has been hailed with satisfaction by the press at Goa, and flattering calculations are made of the advantages that will accrue to the country from the development of this new industry" (Bombay Gazette) A similar sugar is prepared from the date-palm, from the palmyra-palm, and from the Indian sago-palm (Caryota urens) The date palm is very largely used for this purpose in Bengal, and the cocoa nut and palmyra palms in Madras while in Bombay, apparently, sugar is only very occasionally made from the juices of these trees, but when extracted it is most generally prepared from the palmyra or Caryota pulms Some years ago the Government of Bombay, getting alarmed at the growth of the habit of toody-drinking, brought Jessore sugar manufacturers to try the experi-

## The Cocoa-nut Palm Domestic Appliances

DOMESTIC

456

cocoa nut palm calls up a wide range of ideas, it associates itself with nearly every want and convenence of his life. It might tempt him to assert that if he were placed upon the earth with nothing else whatever to minister to his necess ties than the cocoa nut tree he could pass his ex stence in happiness and content. When the Cingalese villager has felled one of these trees after it has ceased bearing (say in its sevent eth year) with its trunk he builds he hut and his bullock stall, which he thatches with its leaves. His bolts and bars are slips of the bark by which he also suspends the small shelf which holds the stock of homemade utensils and vessels. He fences his little plot of chillies tobacco and fine grain with the leaf stalks The infant is swung to sleep in a rude

## Coffee Cultivation

COFFEA arabica CULTIVA-TION.

Habitat -Most authors seem to agree that the coffee plant is indipenous to Abyssinia, the Soudan, and the coasts of Guinea and Mozam-"Perhaps in these latter localities, so far removed from the

No one has yet found it of penetrating into

it will be hard to ilty of germinating, often spring up round the plantations and naturalise the species This has occurred in Brazil and the West India Islands, where it is certain the

coffee plant was never ind genous" (De Candolle) It is a small, much-branched tree or bush 15 to 20 feet in height, with whitish bark and white orange like flowers. The fruit, which is red on ripening, is about the size of a small cherry, and contains two seeds, closely united. These on being separated constitute the coffee berries

of commerce, and on being roasted and ground, the coffee of the shops In India Coffea arabica—the coffee plant—is largely cultivated, but

other species are also met with

2 C bengalensis Roxb, occurs from Kumáon to Mishmi, also in Bengal, Assam Sylhet, Chittagong and Fenasserim Fruit ovoid-oblong (Haring in Chittagong see Agri Hort Soc Ind Proceedings, Oct 1865)

3 C fragrans, Korth, found in Sylhet and Tenasserim Fruit much

like the two last.

4. C. Jenkinsu, Hook f Khasi Mountains Fruit and seeds different from the last being ellipsoid

5 C khasiana, Hook f. Khasi and Jaintia hills Fruit & inch in diameter, smooth, seeds ventrally concave

6 C travancorensis, Il & A . occurs in Tranvancore Fruit broader

7 C Wightiana, W & A , the Western Peninsula, in and places from Coorg to Travancore Fruit much broader than long, with a deep furrow

With the exception of the first these species are not of any special economic importance, and very little coffee is grown in the tracts in

#### HISTORY OF COFFEE CUITIVATION AND OF THE HABIT OF COFFEE-DRINKING

The regions best suited for coffee cultivation he between 15° N and 15° S latitudes, but it is grown as far as the 36° N to the 30° S in regions where the temperature does not fall beneath 55° F (13° C). The area of its cultivation is in fact very nearly the same as that of conton. Within the tropical region it may be cultivated at the level of the sea or even much further to the north and south of the equator than has been indicated The plant manifests, in other words, a remarkable power of endurance, but it does not follow that where it may be grown as an ornamental garden bush it may there afford the com-

mercial product. Within the tropics it will yield profitable returns only

HISTORY

winds, blow away the flowers and make 50 per cent difference in 1000 ft too hot and dry, the plaints require shade, and it strong winds private during the flowering season, belts of forest have to be left to protect the plantation. This is regarded an important consideration in cleaning land for a coffee plantation. Dr. Shortt says. "In low countries there is not sufficient moisture in the soil and when shaded and irrigated, it produces a coarse and uneven bean devoid of the peculiar aroma essential to

the mints or mature influence. On this account the recommendations of the Government of India to prosecute experimental coffee cultivation on the lower Himalaya from Darpling to Kumion have been abandoned. The occurrence of certain wild species on the

seeds

It has been stated that the coffee plant of commerce is truly wild in Abyssinia and that it is there called bun or boun This name

coffee was introduced into Aden by a certain Sheikh Shihabuddin

there arose after some few years, in 1511, a crusade against its use as un-

ed a Greek servant, Pasqua Rossie, for the purpose of preparing it a favoured beverage. His friends grew so fond of it that to prevent their

## Consumption of Coffee

COFFEA arabica. HISTORY.

too frequent visits to his house he recommended Rossie to start a public coffee-shop. This was opened in St Michael's Alley, Cornhill. Coffeecontestance, I may opened in St. Injects Fidely Contents shops rapidly multiplied, but the beverage (although from a very different reason) soon met with as much official opposition in London as it had sustained in Constantinople. Charles II (in 1675) viewed these shops as the meeting-places for disaffected persons, and a royal proclamation was issued for their suppression. Coffee is spoken of as being in use in France in 1640, and the first public café was opened in Paris in 1669 Shortly after, it became general throughout Europe. It may be here added that of the three great dietary beverages Cocoa was the

trade which by 1847 checked the further development of the demand for coffee There are doubtless many causes that may have contributed to bring this about, chief amongst them may be placed the facility with which coffee can be adulterated, the greater consumption of cocoa, and the ease

lative measures appear to have had much to say to the growth of a greater coffee consumption in continental countries than in England, or rather to the decline of coffee consumption manifested in Great Britain with the gen th of the ton damand

be confused with the imports of coffee Great Britain does an immense

that the Arabian variety a slove thought worthy of cultivation." "Local
demands, too, are increasing, as land is being taken up along the lines of
railway between Rangoon, Frome, and Toungoo, and gardens have been
formed whereon enall grantees are now cultivating fruit and other until
trees as well as coffee."

## METHODS.

#### METHODS OF CULTIVATION

State cannot be afforded to deal with even fea up of this subject the reader is referred to the numerous special publicators quoted unfer the paragraph of references, only the more salient features will be touched upon, and especially those which have a bearing on the future expans on of the reflacts.

LOCALITIES, CLINATES, AND SOILS SUITABLE FOR COFFEE CULTIFIA TION AS AN AGRICULTURAL PRODUCT -Under the heading "History of Coffee," the subject of the region of coffee cul watton and the climate pectssare baye been discussed. Dr Shortt sars of soil. "This should be min abound ng in trousure and containing much humas or vegtable mond. consequently we find that the plant thrives best on either red or buck care containing combinations or preparations of mor, and covered our with humes formed by the decay of vegetable mat at produced by dense "Tasts. When these points are overloomed, the results are soon seen in the recognization. The planter, perhaps, instead or choosing forest land, has plantation taken up a poor grasse or eveny evua on and however much waste be may have access to, his plants are duried and soon become vellow, the he resorts to heavy manuring at a very early stage, which materies? we creases the expense of the concern. In hard rocky so is the pus require to be deep vestava.ed to perma of the tap roots of the pant strang perpend causily down, and even when every presention is taken, it will be found that estates opened out on pror sals wal always prove more expensar that the on fores hand, and are not so lasting. The berry produced on rich feregrous day is found to cortain more aroma and the beam is heared when compared with those of other locations. This fact is so well known to collectrolers generally that in London, a new importation is frequently weighted after being reasted. Some difference of opinion personals as to the degree of mosture the soil would not am. In Spreas Englands of the degree of mosture the soil would not am. there occurs he following "The points which determine the value of a pot for code culture are..., erration, 2, apper, 3 she er from words, 4, everer from wash, 5, temperature, 6, rainall, 7, promove to a from S character and richness of soil. Mor of these are necessary reduced a variation according to locality. She er from wind is perhaps of paramount importance and should not be sacr feed for righer sor, as the least can be aruncially obtained much gracker than the former. In wooded commer the estate may be laid out in bolls of to arms, enumbed by

as to prevent the young seedlings from being choked Staking, or sup-

METHODS. Staking, or sup-

The degree to which on the nature of the

ees has deprived the

plantation of the natural protection which belts of trees would have plantation of the natural protection which leafs of the woods have afforded According to many planters, however, all trees should be removed and shade procured through the cultivation of the charcoal tree (Sponia Wights). In two years this forms an ample shade, but as it

and, in his report trees in helping It is a matter for

regret," he a

out break o forwards of

is more important than a complete system of utains and toads. If the operations in this direction have not been completed up to date, the energies of the planter during the first two years may very appropriately be turned to these considerations. Drift surface-water not only removes the soil, but may altogether wash away the plants A proper system of drainage becomes essential, not only to remove the water from damp and cold water-logged soils but to provide against the dangers of sudden

teanches should be fed by

## Coffee Cultivation-Pruning.

METHODS

postpone the operation till the shrubs have borne their maden crop, even though extra staking be required to withstand the wind. His plan is to remote the two primaries at the required height, by a sloping outsard cut close to the stem, and then to remove the top by an oblique cut, so that the stumps resemble a cross, and a firm natural knot remains to guard against the stem splitting down. Hall (Ceylon) contends that the plants should be topped as soon as they have reached the required height, when the soft wood is easily severed by a pinch between the finger and

topped either at their full heightucker to grow up on the weather atter plan is preferred There is the height to 5 feet, not only is

without damage to the tree, but s are more readily made to cover Dr. Shortt says "Pruning con-

sists of various operations connected with either arresting the height of the plants to cause them to spread out laterally, or in removing the additional growth of wood, to encourage the plants to push out not

nder the different pping he exposed s it does

latter is hereas in

first result of topping is to induce the growth of masses of shoots, these are removed by what is technically called handling "The first to appear are vertical suckers or 'gormandisers' from under the primary boughs these are immediately rubbed off without injuring the bark primaries spring secondary branches, in pairs, and at very short intervals All such appearing within six inches of the main stem are removed at once, so that a passage of at least a foot is left in the centre of the tree The object of pruning is to divert the for the admission of air and sun energies of the plant from forming wood and to concentrate them upon forming fruit. The fruit of the collectree is borne by young wood, and as the secondaries are not as the secondaries. as the secondaries are reproduced when removed, they are cut off as soon as they have borne, and a constant succession of young wood is thus secured." (Sports) This removal of secondary twigs from the primary boughts is what the latest and the boughs is what the planters call "pruning" The practical effect of the treatment briefly indicated above is to cause a plant about 5 feet in he ght to develope horizontally primary branches or boughs at intervals of about 6 inches throughout the height of the stem, and to form along these boughs a constant supply of secondary fruit-bearing twigs ing or cross-wise branches or twigs are at once removed, so as to force the plant into the arbitrary and unnatural type of horizontal spreading branches which have the advantage of exposing to the sun and light a large surface from which the crop can with ease be removed practicable, the bushes should be handled twice before the crop, and all practicable, the bushes should be handled twice before the crop. The pruns begin to form, but

hat a flush of so heavy ne necessary to sacrifice

# Coffee Cultivation—Season COFFEA arabica,

this by pruning the plant down to the extent it may be experted to fruit without righty. The lateral or primary boughs should not be allowed grow more than 2½ feet, otherwise they will droop and exclude the light from those below. In pruning, it is often responsed to leave the continuous crops and the continuous crops as the continuous crops as

ear a continuous crop is nipped off, broken, dis

CATH GROPS—Much has been written for and against the growing of other crops along with coffee. In Darpeling it was tred to grow tea and coffee together, but with little or no success, in spate of the fact that the out door labour and manufacture of these crops so fit into each other that economy might be effected. In Natal and other countries, plantans, en

chinery necessary for this purpose

## PREPARATION OR MANUFACTURE

The preparation of the "berry' from the "cherry" may be said to be accomplished in the following stages (1) Pulping, (2) Fermenting, (3) Drying, (4) Peeling, Milling, or Hulling, and (5) Sising and "innovering".

A will make with the written on the agence as a statement discharged.

MANUFAC-TURE.

Pulping.

being ted ous, meffective, and expensive this process does not secure the

ively accomplished if the collections of ripe cherries made each day are passed through the machinery at one. If unavo daily delayed it may be necessary to ferment the cherries before they can be pilped. This most simple machine in use is that known as the "disc pulper." This most simple machine in use is that known as the "disc pulper." This copper roughened by having projections punched forward. A "single palper of this description will pulp 2010 35 bushels an hour and may be worked by three cooles. A "double pulper" of this type has two such discs and is furnished with a feeding roller. It will pulp 40 bushels an hour, and may be worked by from four to us cooles, and double that amount if worked by worked by from four to us cooles, and double that amount if worked by

Coffee Manufacture.  steam The discs work against smooth iron beds so adjusted that the complete cherry cannot pass between They are torn upwards against the beds, and the projections on the discs tear off the pulp, allowing the brancheds, and the projections on the discs tear off the pulp, allowing the brancheds.
complete cherry cannot pass between They are torn upwards against the beds, and the projections on the discs tear off the pulp, allowing the beans
to drop into one receiver and the fragmentary pulp to be carried into another. The disc pulper is in fact somewhat like the cotton gin which drags the fibre forward and drops the seed behind. The 'climder pulper' is an older invention in its conception, but has been improved and perfected to a much greater extent than the disc, the latter, being the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the
cherries are spread out—the pulpin By constructing this building againt therries may be carried direct into assed A good supply of water has also to be conveyed to the loft so as to descend with the cherries into the pulping machine in a continuous tream Space cannot be afforded for a discussion of all the inventions and contri-
re separated re separated op pass once afrom the loft of a tube which dips to the bottom of a basin known as the logber. Stones subside in the hopper, while the continuous stream from above causes the hopper to discharge a uniform supply of cheries and water to feed the pulper.  Framsentiao. The parchment coffee, which may or may not have been assorted by contrivances in the pulper and seves, has now to be framed to be a supply of cheries and seven to be form the control of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the desirable of the

believed to be due to want of depth of son, but commate and had cultivation may have also to do with it Rot or the withering of the young leaves is due to wet and cold

There are, how ever, certain specific diseases some of which have protectally baffled both the planter and the scientists, and have proved so disastrous as to have much one plant turns in large tracts of country. This has been the case wit Copie has been the case with Copie and the leaf high having there proved so far incurable as to have causer the planters to substitute ta. for coffee interestants. Numerous rether plants have been planted such as those by Marshall Ward, Niether, Eddit have been problem. Porbes Watson, Morris, Cooke, Baffour, Re. To review even build have been sufficient on the discusses of the coffee plant have been considered in the present outline of the coffee industry. It may be said that the specific diseases are referable to two sections—Fungoid and Intention.

I The chief Fungoin diseases are —(a) Leaf blight —This is a fungod disease which is supposed to have first made its appearance in Ceylon in 1869 and to have appeared in South India two years later. It has since appeared in Java and Sumatra, but does not seem to occur beyond the limits of the Indian Ocean. It is caused by the fungus Hemileia vasiatinx, an organism alhed to mould. It attacks the underside of the leaves in the form of spots or blotches, at first yellow, but which ultimately turn black. These spots are covered with a pale yellow powder. They eventually exteend over the whole surface of the leaf, which then drops from the contract of the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from the contract of the leaf, which then drops from

ar, but in its in the form of k and leaves ial cure, but

with little success If powdered sulphur, alone or mixed with causuic line, be blown over the plants and sentiered on the ground below the boughts, the disease is prevented and the coffee plants seem at the same time be benefited Thiss, however, expensive and is more a preventive than a cure. When once the disease has taken hold of the leaves nothing has yet been discovered that will destroy t without at the same time for the plants.

(b) Leaf rot or Candelillo is a disease attributed by Dr. Gooke to the fungus Pelicularia Koleroga, Cooke. It is prevalent in Mysore plantations in July, the leaves, flowers, and berries becoming covered with a shipy

#### Diseases of the Coffee Plant

COFFEA arabica DISEASES

relatinous substance which turns black about the time that the affected parts fall from the plant (New Reports 1870 30 and 1880, 35)

II Of the INSECTIFORM diseases met with in India the following are

those which give most trouble -

(c) Borer—This pest used to be known as the "worm" and "coffee". It is most troublesome in South India, especially in Coorg and the Wynaad, where in 1865 66 it destroyed whole estates It has been determined as the beetle Xylotrechus quadrupes It is red or yellow, with black in transverse lines It damages the trees by boring holes into the stem usually a few inches above the ground. These passages are at first transverse but soon ascend sp rally to the growing tip where the larvæ are matured The plant early shows s gns of death, and ultimately withers down to the point where the beetle entered. This pest is most prevalent in hot exposed gardens, and may be kept in check by free irrigation

destruction of the parts to which it adheres the flowers and young fruits fall ng freely. The pest does not do much harm however until it has been two or three years on an estate It prefers cold damp plantations at about 3 000 feet in altitude. This bug may be first recognised as brownish wart like bod es These are the females each of which produces some 700 eggs Fortunately this pest is freely attacked with parasites which

greatly help the planter

The black bug is known as Lecanium nigrum Like the preceding this attaches itself to the tenderest shoots it also prefers gardens at high The female somewhat resembles a scollopalt tudes in damp situations shell WI en the eggs are incubated the twigs become covered with an

the young bernes what like a wood-

It is flat, oval, ng across the back

It seems to prefer hot dry plantations and disappears with the rains, only to return in time to destroy the setting of the fruits. It is found on the roots about a foot below the surface of the soil in the axils of the leaves and among the clusters of flowers and young fruits. It may be easily recog nised by the white excretion formed around the larvæ

All these and the other less known coffee bugs have a strong d slike to tobacco juice They may be prevented from developing to an injurious extent by brushing the twigs with tobacco Some planters recommend saltpetre and quicklime in equal proport ons dusted on to the affected COFFEA

#### Diseases of the Coffee Plant

### COPPRE-LEAP TEA.

It has long been known that coffee leaves, if cured by a process similar to that adopted with tea leaves, afford a beverage which contains sufficient Caffeine to entitle it to a position as a cheap substitute for tea or coffee Indeed, according to some writers, the leaves contain more caffeine than the berries. A decoction from the leaves is a did be regularly used by the inhabitants of Sumaira, especially at Padaga. AM - John Gardener of London even patented a process for manifacturing and partially roasting the leaves, from the belief that they were likely to come into use in Europe Unfortunately, however, leaves have an unpleasant senna-like flavour which greatly maintee leaves have an unpleasant senna-like flavour which greatly engines the leaves have an unpleasant senna-like flavour which greatly engines the leaves have an unpleasant senna-like flavour which greatly end the leaves have an unpleasant senna-like flavour which greatly be leaves have an unpleasant senna-like flavour which greatly be leaves have an unpleasant senna-like flavour which greatly end to be been a compared which a compared which a compared with a flavour than for the flavour and confecel-eaf might be sold at 2d a pound as compared with a prof. ## The Uses of Coffee

COFFEA arabica.

the rossing of the berries a larger amount is developed, to which the aroma is due. Caffeine appears to act as a stimulant to the nerveus system. Coffee leaves have been used as a substitute for the berries they contain caffeine Mr. M. Ward of Padang writes regarding the use of the coffee leaves as follows. I was induced, several years ago, from an occasional use of the coffee he to adopt it as 4 duly beverage, and my constant practice has been to take a couple of cups of strong infusion with milk in the evening as a restorative after the business of the day. As a beverage the natives universally prefer the leaf to the berry g vings, is a reason, that it contains more of the bitter principle, and is more nutritious." The best mode of rosating is by holding the leaves over a fire made of dry bumboo or other wood which gives little smoke. When sufficiently rosated the leaves have a buff colour, they are ground to a powder and used in the same way as coffee (Hanbury) are ground to a powder and used in the same way as coffee (Hanbury).

#### COFFEE PULP

COFFEE PULP. 1677

It has long been known that the ripe pulp of the coffee cherry contains an amount of sugar which in ght with advantage be converted into alcohol. At present the washings from the pulping machine are run off and no advantage taken of the sugar they contain. Several writers have urged the planters to utilise this by product, but as yet no definite steps have been taken in that direction. It is indeed even questionable whether or not it would pay the planter to direct his attention to a perfectly distinct enterprise. The tendency of the present day is to enable the manufacturer in every branch of industry to compete to the last degree by affording him the means of deriving additional revenue from the waste or by products of his industry. In this light it seems pos-

the production of the future and the most all mask is employed in the preparation of the influsion known as abstract action. For Shortt states that according to his experiment as the production when steeped in water until fermentation sets in, yielded on distillation 1 or of spirits. If not employed in this manner, might not the dired husk find a demand as an auxil ary to cattle God.

#### OIL

01L 1678

The term 'Coffee-oil' is in the trade given to palm oil in which the kernels have been more or less burnt during the process of extraction

aroma might be restored to the coffee or employed to flavour liqueurs. This empyreumatic oil is formed during the roisting, and probably at the expense of calleine and other constituents of the coffee (see under Chemistry)

#### MEDICINE.

MEDICINE 1670

Coffee while not officinal in the British Pharmacopreia is so in that of the United States of America Many medical men, however, recommend its use in England for mild affections. Its dietary property, as a

## COFFEA arabica.

## The Uses of Coffee,

MEDICINE.

stimulant to the nervous and vascular system, is that upon which its claims to medicinal recognition depend. It produces a feeling of buoyancy and exhilaration resembling the first effects of alcohol, but it is not followed by depression and collapse. It increases the frequences of the pulse, and stimulates the system to throw off feelings of fatigue, or to sus tain prolonged and severe muscular exertion. It has even been contended that caffeine has the power of checking the waste of the tissues Lehmann found that the distilled oil had this effect in quite as strong a degree as tea The well-established property of coffee in preserving wakefulness depends upon its stimulating property on the nervous system When swallowed it produces a warming cordial impression on the stomach, quickly followed by a diffused agreeable nervous excitement which extends itself to the cerebral functus giving rise to increased vigour of imagination and intellect without any subsequent stupor such as follows on the use of most other stimulants. Moleschott found that it -0 pag 11 -

cient energy of the brain are manifested without congestion or inflammation. In light nervous headaches, not proceeding from derangements of the stomach it often proves immediately effectual. It has acquired much reputation as a palliative in the paroxysms of spasmodic asthma, and has been recommended in hooping-cough and in hysterial affections. "Hayno informs us that in a case of violent spasmodic disease,

highly recommended in cholera infantum, and it has even been used with asserted advantage in cholera. It is said also to have been used successfully in obstinate chronic duarrhoca" (United States Dispensatory)

Coffee is much less astringent than tea, and hence it does not cause constipation so readily

Wood states that "upon those who use it habitually, its characteristic influence is not fully evinced, as it has either lost its power in a great in the property in its the regimary in its

to sa a tonic to the digestive organs, and more astringent in consequence of the amount of tannic acid it contains

Certain it is that tea, especially black to the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country of the country

COFFEA arabica. MEDICINE.

coffee in France is supposed to have abated the prevalence of gravel in that country. In the French colonies, where coffee is more used than in the English, as well as in Turkey, where it is the principal beverage, not only gravel, but gout, is scarcely known"

Unroasted coffee has been employed in intermittent fever, but it is much inferior to quinine Roasted coffee is said to have the effect of mposing animal and

beneficial application

coffee, burnt in the wards of a hospital early in the morning, is a deodoriser, and a very fragrant one" (P. Kinsley, Honorary Surgeon, Chicacole, Ganjam, Madras Presidency) ' Is also an antisoporific, when consumed in large quantities, is supposed by the Arabs to have an anaphrodisiacal effect." (A S G Jayakar, Surgeon Major, I M D, Muskat, Arabia) "Dried coffee roasted in an open vessel is a useful deoderant" (Henry David Cook, Surgeon-Major, Calient, Malabar) "Is an antidote in opiumpoisoning (G. A. Watson, Allahabad)

CHEMISTRY.

CHEMISTRY. 1680

The roasting or torrefying of the coffee-beans, combined with the pulverising they are afterwards subjected to induces certain changes to which in a large measure the flavour and aroma of the coffee are due. The woody tissue becomes friable, and at the same time certain chemical changes take place The chief organic constituents of raw coffee are caffeine, fat, caffeic acid, gum, saccharine matter, legumin, and cellulose Paven gives the following analysis -

## Chemistry of Coffee.

CHEMISTRY.

Should the whole of the testa of the seed (the silver skin of the plant

roasted together, the coffee will be much inferior to that obtained by roasting carefully picked and assorted beans. The degree of roasting required for one class of coffee is not the same as that for another. The heat should not be greater than is sufficient to impart a light brown colour to the bean When roasting is carried too far, a disagreeable smell and a bitter and acrid taste gradually mingle with the essential aroma, and thus lessen the merit and value of the coffee By reducing the beans to charcoal the aroma and flayour are entirely destroyed. When the roasting has been effected to the right extent, the volatile oil is produced at the expense of some of the other constituents the table above will show that nearly the whole of the saccharine matter has disappeared This is not the case with the sugar in chicory or other roots, a large proportion remaining as sugar, and hence the rapid colouration imparted to water by a coffee powder containing chicory or other cane-sugar-yielding roots, as compared with pure coffee There is something altogether peculiar in the behaviour of the sugar of coffee under the influences of torrefication. How the volatile oil is formed seems to be a puzzle This oil has been termed Caffeone, and it is the aromatic principle of coffee It is wholly the product of torrefication, the materials of which it is formed being obtained by the destructive influence of heat on the and a me te anantites, con-

BURMA. Pegu.

In the Pegu District five " ---- a farm near channel Lind known as cheik or kveiktlis which or

for food or for ornamental t white, the other brown grev.

A brown edible form is cultivated—a polished grain with the characteristic long, thin, and slightly swollen ruish the cylin

drical from the pear-shaped forms. The best quality is said to come from

the upper valley of the Pegu river

In Hanthawaddy District some seven or eight forms exist in a wild state or are cultivated One only is grown as an article of food, namely, a slaty brown irregular grain, of a dull colour, furrowed, and with an This is found only on the plains, is called Kyeikthi, and is sold for 8 annas a basket All the others are wild or cultivated, but collected purely for ornamental purposes

One is a medium-sized steel grey seed,
smooth, shining, and pear-shaped

Three are pinkish brown, small, of the flattened spheroidal form, and the most perfect beads in the whole collertion of Coix seeds before the writer These have been lettered B D and v command

fished, with , impossible ples of the ignment of bove under

Pegu, the sample marked G, agreeing with the so-called "male," and C with the "female" form

In the Prome District both spherical and cylindrical forms are said to occur, wild and cultivated Of the samples forwarded along with the - challed form, which, 1 1-. writer, must be imples furnished

the longer form r. The Denuty \_\_\_

Job's Tears.	COIX lachryma.

Commissioner deals in his report with a much more extensive series than | FORMS OF, he has furnished samples of He says the forms of Coix are known collectively by the name Kyeskths The cylindrical being Kyeskshe (literally, long Kveik', of the globular form there are names to distinguish certain recognised types thus - Kyerkohun, white Krerk, Sakyerk, edible Kyerk, Pyaung, or maize-like Kyesk, and Kyeskni, or red Kyesk

In the Tharrawood's District the Deputy Commissioner says that all the forms are known by the Burmese name Kyeikthi, but that a large round edible form is known to the Karens as Be, and is cultivated, while another smaller round kind is known as the Be-ma (or female Be) and is collected for ornamental purposes He further forwards a sample of the cylindrical grain, and says it is known as the Be-kwa.

### ARAKAN DIVISION.

In the Akvah District the pear-shaped form is both wild and cultivated. From the town of Akyab, the Deputy Commissioner has furnished three samples of the wild plant, the seeds being smooth, polished, and very hard, especially a brown form. He states that these forms grow in the low marshy lands and are not eaten. He, however, furnishes a sample of a cultivated form obtained from Mychaung-the largest Core grain yet examined - which fully supports all that has been stated above. It is steel grey, deeply grooved, with a loose shell and pronounced basal swelling The Deputy Commissioner describes this as "the cylindrical form," but while it is certainly longer than the Akyab grain, it is not the cylindrical form (var stenocarpa) described above, but is a monster form of the ordinary cultivated pear-shaped grain

In the Kyank-py a District three forms of Coix occur-two wild and one The writer has not seen any specimens of these, yet has no cultivated reason to doubt but that they would answer very much to the types described under Akyab One of the wild forms is larger than the other and is known as raises or kalinses, while the smaller form is the chitses edible form is also known as chitsee, and is both eaten and made into beer.

### TENASSERIM DIVISION

In the Amherst District both the round and cylindrical forms are grown, the former being eaten, and the latter used for ornamenting ladies' dresses A wild round form is said also to exist. Samples have not been communicated, but the Deputy Commissioner reports that both are known as kveit

In the Shwe-gyin District no form of Coix is known

In the Taung-ngu District it is stated that the cylindrical form grows wild, while the globular is cultivated : both are known as kyeit : the former

wild, while Nos 4, 5, 6, and 7 are used for ornamental purposes, and No 4 is extensively eaten. It is worthy of note that of these samples only those cultivated, vis , Nos 1, 2, and 4 have the shell or involucre furrowed-the others are smooth and shining

(1) Kalesk is a dark brown or bluish black pol shed grain of the pearshaped ecries.

Job's Tears.

FORMS OF.

"The cylindrical is sown by the wild hill tribes on Kaung land or on the slopes of hils. They do not till the land for this purpose, the seeds are thrown broad-cast, and no care is taken of them. In times of scarcity of food the cylindrical are caten, but now they are only used as ornamis for their dresses." The Deputy Commissioner of Kyaukpyu writes regarding a beautiful hard round form which is collected from the wild plant and used for ornamental purposes. Of the cultivated forms he says this is Known as Chittee. "It grows in June and July and dies in November and December. The plant is 4 or 5 feet high and like a reed". But a smaller, more deheate, wanter is also cultivated, which he remarks is eaten and also used in the manufacture of the small between Known as Khanag." He adds, "The seed has to be cleaned and has the taste of maize." Of the two kinds grown he says. "The plant, however, differ widely ir other respects, and I am unable to say if the belong to the same variety or not."

Charactera or the Fibrial Fasian—On breaking the outer shell, a

CHARACTER OF THE EDIBLE GRAIN—On breaking the outer accounty-shaped grain is obtained which, Professor Church says, bears on being cleaned the proportion of 1 to 4 to the total weight of the unlusked

article. The Professor gives the following analysis-

seeds suitable for the above purposes. The writer was not able at the rome to fortow these performen with samples of the cylindrical seeds which repeated reference has been made above, but he gave them samples of the ordinary edible pear-shaped form They seemed to think three might be some prospect of even that form coming into use. On being shown the Karen ornamented dresses they professed a firm conviction that the cylindrical grain would find a ready sale. This led the writer to show these garments to Mr. W T Thieston Dyer, Director of the Royal Botane Garden, and in consequence a requisition was in due course forwarded to the Government of India asking that a thorough

COLLECTION.

tend that they were made of a sea weed which the bird collected for the purpose and chemically changed in some my sterious way. Ure (Arts, Manufactures, and Mines) says. "The nests are made of a particular species of sea weed which the bird macerates and bruises before it employs the material in layers so as to form the whitsing gleatinous cup-shaped nests so much prized as restoratives and delicates by the Chinese." On the other hand, many recent writers discredit this theory and believe that the gelatinous material is either the natural salin a of the bird or a substance that the better qualities of the nests are found in caves far removed from that at the better qualities of the nests are found in caves far removed from the sea. Some of the nesting caves of Borneo are 140 miles from the sea. Mr deRopstorff points out that there are no edible nests in the Nicobar settlement, but a few miles off in a richer tract of country where meet life abounds they are plentiful. "It is thus," he says, "in places

This plant, which is a native of the Lower Provinces, is the only member of the genus which the natives of India regard as poisonous. It is sometimes used medicinally, but is never eaten

COLOCASIA VICOSA.

Poisonous Properties of Aroids

CHEMISTRY 1739 Chemistry—Through the kindness of Messrs Pedler and Warden (Professors of Chemistry in the Calcult's University), the writer has had the pleasure to receive an advance copy of their paper's on the chemical properties and medicinal uses of the species which, by the early botanists, were all treated as belonguist.

been thrown into some half a

paper was to investigate the and the enquiry was suggested on teceiving, from the course of the Dibrugarh. Some portions of rive Bish Kachu tubers and leaves with the following statement. A cooly woman administered some of premising kachu to another sick cooly on the same garden, but the max high remaining was solved to the cool of the same state. The cool of the premising was so thrown away and field in an hori. A second pig was experimented on with some of the same stuff, and fatal results also supervened. During the course of the same year a second case of poisoning by kachu was referred to the Chemical Examiner's Department, in this case sices of kachu tubers were introduced into a jar containing "goor."

writers on economic botany say that the bish kachu is Colocasia virosa, and accepting this to have been, in all probability, the plant Pedler and

bolic extract was prepared and found to have no poisonous effect line some result followed on the administration of a distillate which was found to have no acrid taste, and, as with many other vegetable substances distilled aith water, it was found to contin a trace of hydrocanae and "It is possible, however that certain varieties of ARUM may contain larger amount of prussic acid, as, for example, the A segulation of the West Indies, which is stated to furnish a juice, two drachms of which however that certain proceed facts in a few hours. The tubers left in the retor after distillation with water were still physiologically active, indicating that the activity proceed that of the proceed facts of the proceeding with water of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding of the proceeding

CHEMISTRY.

in cold distret nitric or nyurochiotic acid

1 nece appears to us to be no reason to doubt the fact, that the whole of the physiological symptoms caused by Arums are due to these needle-shaped crystals of oxidate of lime, and that the symptoms are thus due to purely mechanical causes

crystals on microscopic examination of dried Arums as we had found in the fresh tubers. We explain this apparent anomaly in the following simple manner. In the fresh condition of the tubers, the bundles of crystals of

in the drying of the tubers, the

rer a smaller area. And thus,

penetrating the tissues, the bundles act as a whole "
The poisonous effects of certain aroud tubers are therefore the result of mechanical irritation, similar to that produced by cowage (Mucina Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court of the Court

of mechanical irritation, similar to that produced by cowage (Macina pouries) or to chopped hairs criminally mixed with food it would be interesting to have this line of enquiry carried to its final issue in a systematic examination of all the plants, like rhubard, which contain raphides It is just possible that the crystals of oxalate of lime may

chemically analysed, but it may be said we have not advanced much nearer as full understanding of the chemistry of rhubart connected with its physiological action than we were before. It is thus probable that the results of Pedler and Warder's analysis of the arroid tubers may have a more extended influence on therapeutic science than they seem to have realized.

CORAL

thousands of feet of white calcareous mud that, long since upheaved and hardened into chalk, greets the homeward bound Indian in the Dover Cliffs, had yet to be slowly extracted through long ages from the sea water by minute organisms long since extinct."

#### R ... OPNAMENTAL CORALS.

ORNAMENTAL CORALS 1818

Very little can be learned for certain of the indigenous living ornamental corals. Indeed, it seems probable that in some of the passages - p.La Loan made to comit in a manager conce alread of the CPETES

ıng indige

since, for ornamental purposes, it is only the sclerobasic polypes that form a calcareous substance of sufficient consistence to admit of being cut White

Black 1824 Red 1825 Rurma 1826

calls "club-shaped Porites" He also says -"I have noticed in the bazars, though I have never gathered it on the coast, a curious species of coral resembling the horse-tail Isis It is branched like a tree with white strated stony joints and black horny smaller joints between, which render the whole ffexible" It may be here remarked that man of the colambian on ale has a alternation more one of a colorana of

long moss, also occurs, and 'black coral,' of which beads are made, is brought from the Mergui Archipelago" Of Tenasserim Mason further says —"A tree coraltwo feet long, of a deep scarlet, is found on the coast, which the residents often call 'red coral,' but it is not the red coral of commerce, it does not grow like that, and the red colour is confined to the epidermis, the substance of the coral within being grey "

In concluding this brief review of the literature of the Indian ornamental corals, it must be admitted that we are grossly ignorant of the subject. There are no coral fisheries in India, and we do not know whether or not this is due to the absence of corals of commercial value, nor do we possess any knowledge as to the likelihood of the more

1823

# CORAL. Trade in Corals. valuable corals succeeding, if introduced into Indian waters No effort has as yet been made to propagate new species or improve the existing Indian corals. TRADE. TRADE IN CORAL. 1820 Some conception may be arrived at of the magnitude of the trade in Coral when it is recollected how many races of people in India regularly wear necklaces of coral. How far the prized ornaments may be derived from Ind ac sees t d coral ne years · his may ent. in 136 and 18 Of some-Prepared. again 1830 Beads. 1831 Imitation. 1832 confession, or a pub-rintial dyall tracts. The bulk of the bought by those classes to be worn as necklaces, the coral beads, when a man is prosperous, alternating with gold beads. Almost all the coral beads were received to the corrections of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the correction of the corr we receive is brought to Calcutta, whence it is distributed over the provinces mentioned, to be sold chiefly at the larger fairs. It is principally Medicine.—In addition to being used for adornment ornamental n serv ancient time and are MEDICINE. ed by being 1833 nd corals are onsumption,

CORCHORUS acutangulus.

JUTE. 1839

The Angular Fruited Corchorus.

CORCHORUS, Linn.; Gen. Pl., I., 235.

The generic name for this group of annual plants is derived from the property of the leaves (κορη the pupil of the eye, and κορη ω to purge or clear).

1840 Corchorus acut

Corchorus acutangulus, Lam.; Fl. Br. Ind., I., 398; Wigh!, [TILIACE E.

Syn.—C Fuscus, Roxb., Fl. Ind , Ed. C.B C , 429, Ic t. 739 Vern.—Titápát, Beng.

wild species in India,

the hotter parts of

India and Ceylon. Roxburgh remarks that it flowers during the rainy and cold seasons, is never cultivated, and differs from C. tridesians, L. in having only one style; and from C. tridesians, L. in having only one two seeds in each cell. Dalzell and Gibson say that in Bombay it is a common weed, and Roxburgh that it is a native of vanous parts of ladiation.

Botanic Diagnosis,—Alone distinguishable from C. ohtorius by the host rounded capsule—a very unimportant character. Gamble's No. 1502 has one capsule nearly round, while the others are distinctly those of olitorius, but some are 4-valved, others 5-valved. Kurz's No. 123 of C. acutangelius has both4- and 5-valved capsules, and Clarke's No. 21,503 has a 3-valved capsule. Olarke's No. 31,637 of C. triloculans, bas at valved capsule, and Hooker and Thomson's sample of that species, from the Panjab, has a 3-valved capsule.

Habitat.—A common plant "throughout the hotter parts of India". This statement, originally made by Roxburgh, is current in the hieratur of jute. While it need not necessarily be implied that a plant is wild (e.g., indigenous) in the area where it is common, still that is the opinion popular writers have derived from the above carefully worded botancial description. The major portion of all we have learned regarding in the opinion of the provide the consolite ton-

either C. capsul wild or rather indigeno in some parts of Western India, but grave doubts may be entertained as to either being natives of Bengal,-the province where they are now mainly cultivated, and where they exist frequently enough as weeds around the cultivated jute fields. The suggestion is offered, that, by experimental cultivation, it might be found possible to produce forms of Corchorns from some of the truly wild species which would closely approximate to C. capsularis and C. olitorius. With the imperfect knowledge we possess of this subject, the writer would be much more willing to admit the possibility of some such theory, to account for the cultivated jutes, rather than believe that manifest escapes from recent cultivation are the sole survivals of the wild forms of these plants. The scientific distinction based on the length of the fruit vessel (round in C. capsularis and elongated in C. olitorius) is, to say the least, scarcely worthy of as much consideration as the peculiarities recognised by the cultivators in distinivated forms that vield the

> distinction in the shape to give origin to certain

species or citassics, an or winch can be produced from the seeds of any one by careful cultivation

It is noteworthy that definite Sanskrit names should not exist for these most useful plants, while other plants of far less value have assigned to them names so process as to distinguish their varieties, to separate their wild from their cultivated forms, and to indicate every possible structural peculiarity. There are neither Arabic nor Persian names for the

urged that when Roxburgh was told that the plant grown in the Botane Garden was jute, there were in all probability no such dealings in the fibre between Calcutta and Eastern Bengal Besides, Mr Kerr rejects this derivation of the word, on the ground that jute is in no way a waste, rejected, by-product or remnant, as would be implied by the word with that A the same time Mr. Sen's idea would simply be that it was in

1852

Roxburgh were most probably, as at the present day natives of Urissa, and that, therefore, the name jute given by Roxburgh, the first European writer who used that name, was in all probability a soltened form of just, a word which may be admitted to have come from the Sanskri thate, unless we presums Mr. Sen's derivation of the word to have prevailed all over Orissa prior to Dr. Roxburgh's discovery of the plant.

The Sanskrit word Nedika is said by Dutt to have been given to distinguish and kelazaka to O capsularis, but while Dr. Dutt's work is devoted to the Matena Medica of the Hindus and is compiled from Sanskrit medical works, he only gives the above names in a Glossary at the and, and does not attribute to the plants, to which he says they refer, and, and does not attribute to the plants, to which he says they refer, but properties as known to the Sanskrit writers, while the modern Hindus we he leaves of jute and the species of Corchorus generally, both as food and medicine Dr Moodeen Sheriff, a high authority on vernaular control of Scale 1. ich is often square on section, obliquely and sharply truncate at both extremities, hlum large with a raphe-like cord thrown from it to the top of the seed crossing one of the angles. The writer would be disposed to unite C. tridecar and the same with these, into a section characterised by the seeds, he species C. urticacfolius. He can put no reliance on the presence of absence of a short style or of a spreading stigma, as he has found both these conditions on the same plant. The fruits of the species of Corchorus are

te glabrous fruit short

more variable than any other part of these plants.

Habitat—The Flora of British India striets that this species is met with in the N-W Provinces, the Panjab, Sind, and south to the Nighr hills Roxburgh, however, says that it is a native of Bengal, and florard, Sholf-about the end of the rains, and Lieboa that it is found in Gujard; Sholf-about the end of the rains, and Lieboa that it is found in Gujard; Sholf-about the cond of the rains, and Lieboa that it is found in Gujard; Sholf-about the cond of the rains, and Lieboa that it is found in Gujard; Sholf-about the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of the conditions of th

It is desirable to draw sponsible for the lact that the record of the jute trade preserved by merchants bears a close approximation to that tabulated by Government from the very extensive and complicated returns of road, river, and rail-way traffic, the concentration in the ultimate centre contents of the stream of supply. But Mr. Francane concludes his review of Mr. Wilson's figures as follows.—"If the annual average of the eight years ending 1834, see taken into consideration, the difference between the two sets of figures is not considerable, the estimate worked out in this office from the data above described being only 30g per cent less than that of Mr. Wilson's

Soli 1887

Soil - Jute seems to be capable of cultivation on almost any kind of

Climate 1888

Preparatio

1880

down

Preparation of Soil—It may be stated that, when the crop is to be raised on low lands, where there is danger of early flooding, ploughing commences carlier than upon the higher lands. The more clay in the soil, the more frequently it is ploughed before sowing. The preparation thus commences in November or December, or not till February or March, the soil is generally ploughed from four to six times, the clods are broken and pulserised, and at the final ploughing the weeds are collected, dried, and burned.

Seed—No special attention is paid to the selection of good seeds, nor do the cultivators buy and sell their seeds. In the corner of the field a few plants are left to ripen into seed, and these are, next year, some broadcast. The sowings, according to the position and nature of the soil, commence about the middle of March and extend to the end of June.

Harvest —The time for reaping the crop depends entirely upon the date of sowing; the season commences, with the earliest crop, about the end of June, and extends to the beginning of October.

Seed 1800

Harvest.

#### CORCHORUS The fute Fibre CULTIVA-The crop is considered to be in season whenever the flowers appear, and past season, with the fruits. The fibre from plants that have not flowered is weaker than from those in fruit, the latter is coarser and wanting in gloss, though stronger It is late reaping that is chiefly accountable for the coarse fibre found in the market. Crop Crop -The average crop of fibre per acre is a little over 15 maunds. 1802 but the yield varies considerably, being as high as 30 to 36 in some and the also very dependent idapet farm, the ground, verage yield 1 1 40 430 Retting 1803 two or three days, to give time for the decay of the leaves, to discolour the fibre in the retting process, in others the bundles are carried off and at once thrown into the water. There is some ground for thinking that, if the drying of the leaves by stacking does not prevent the discoloration of the fibre, the fibre itself is likely to be benefited by the process, since it is found to separate more readily from the stems, and is thereby saved from the danger of rotting from over maceration In some districts the bundles of jute stems are submerged in rivers, but the comcome to be in favour of tanks or road-side stagnant pools ure of the water, the kind of It varies from two to twentyisit the tank daily, and ascerias begun to separate from the This period must not be exceeded, otherwise the fibre becomes stem rotten and almost useless for commercial purposes. The bundles are - an the ton of them sods and mud s rapidly completed vater, proceeds "to lext the roots, and, t sie management brought s to wash his head, it through throu, he d) remain 1 water as dry in the ttle doubt Extraction by la simple Machinery he dry jute 1801 scured even by the poorer culindustries might spring into machinery will, for some time and that the princ pal mineral of

#### of Burnosan Commerce

CORCHORUS.

Mr W Cogswell, however, who is an undoubted authority on all questions connected with jute, expressed in December 1881 his opinion that a softer fibre was obtained by the old process (vide A H Society's Proceedings, December 1881).

#### PROPERTIES OF TUTE FIBRE.

PROPERTIES OF JUTE 1805

Chemical and Microscopic -" The fibre, as found in commerce, consists of the fibre bundles separated from the cortical narenchyma. The bundles contain 6 to 20 fibres. The fibres are firmly coherent in the bundle, the cohesion taking the form of fusion of contiguous walls, the line of fusion being very apparent. The ultimate fibres are of the normal fusiform type, 15-3 mm in length In section they are seen to be thick walled and polygonal Reactions, characteristic of the inte-allied group of fibres, are brown with jodine, deep vellow with an line sulphate, purple with phloroglucol and hydrocloric acid, a strong affinity for the basic colouring matters Mercerised fibre-Microscopic features Concentrated solutions of the alkalies have a remarkable action on fibres of this They resolve the bundles more or less completely, and cause the fibre wall to swell so as to almost obliterate the cavity. The filaments, in addition to being made finer, are much softened in texture, and develop a wavy outline, giving the fibre very much the appearance of wool' (Cross. Beavan, King, and Watt Report on Indian Fibres, 6 26) chemical analysis, as given in the report just quoted, may be here briefly reviewed Jute, in point of percentage of cellulose (perhaps the best criterion for judging of the value of a fibre), is about equal with Urena Criterion for Judging of the value of a note, is about equal with observing 7, Calotropis 765, Abntilon 750 and Agare 758, and follows after Abroma 800, Rhea 803 Flax 819, Sida 831, Crotalaria 830, Marsdenia 883 and Girardinia (Nilgiri nettle) 896 Jute possesses 760 per cent, and is thus in point of cellulose about the eighth most valuable fibre in India It is noteworthy that of the fibres enumerated—Abuti-ion, Urena, Abroma, Sida, and Jute are obtained from closely allied plants and yield very similar fibres. But of these lute is the next to the last in point of chemical merit, Sida being the first of the series is a fact of the greatest importance, when it is added that the experts who examined these fibres at the Colonial and Indian Exhibition pronounced

Mercerised. 1806

Cellulos.

Ash.

the cell carty completely, thus causing the filaments to become much finer and soliter in texture By intration just gains in weight, becoming 128, being in this respect inferior to any of its allied fibres, but it is found to contain 4,7 per cent of carbon having the highest amount of any recorded Indian fibre, Sida, for example, possesses 45°2, flax 43°0, and Bauhnan fibre only 40°7

#### ORCHORUS

### The Jute Fibre

ROPERTIES OF JUTE.

The results of the chemical and microscopic investigation of jute, instituted by Messrs Cross, Beavan, and King, may be briefly stated to

Strength 1800

woo!

Strength and Industrial Properties .- Royle remarks " Jute is certainly characterised by fineness, silkiness, and facility of spinning, but it is less strong than many other Indian fibres, which are possessed of similar

to the cultivator's necessities and the manufacturer's wants is not, therefore, one as to whether jute or Sida is more easily cultivated and

The question

gives the better result in point of yield of fibre, but whether the intrinsic superiority of Sida fibre would justify its experimental and systematic cultivation until a stock was produced that could be grown as readily and admit of as rapid decortication as is the case with jute. The plant is wild to-day, and it is unfair to compare the yield of fibre from such a plant with results obtained from jute After careful cultivation for 10 or 20 years it would be fair to compare the ease of cultivation and yield of fibre in Sida with that of jute and during this experimental stage remunerative returns might easily be obtained since there can scarcely be two opinions as to the superiority of Sida over jute for the finer textile purposes Roxburgh found in his comparative tests of the fibres of India that a "dry line" of Corchorus capsularis broke with a weight of 164lb and a "wet line" with the same weight, whereas Corchorus olitorius gave way with 113 and 125h respectively, the wet line gaining over olitorius is well known in modern commerce To compare with these results it may be mentioned that, under the same test, a "dry" and a "wet" line of sunn-temp broke with 160h and 200h, respectively, the

1000

latter gair water for

Corchorus

give way observed in the tanned ropes, but the tarred seemed to present strength considerably, the line fresh and tarred broke with 61h, and after

maceration for 116 days bore a weight of 60th

IQQI

The defect of jute is the difficulty to spin the higher counts 20 being about the finest made, commercially, and when manufactured the fabric lasts well, so long as it is not submitted to a damp influence, but rots rapidly when damp and exposed to the atmosphere.

#### EXPORTATION AND HOME CONSUMPTION

EXPORTS.

The following abstract of the FXFORTS OF RAW JUTE FROM CAL-CUTTA will be found interesting, as showing the steady and constant increase and development of the jute trade. The mean exportations for

$\mathbf{U}_{\mathbf{P}}$ to							Average of five years in cwt
1832 33	•						11 800
1837 38							67 483
184 43			•				117 047
1847 48							234 055
1852 53							439 850
1857 58					•		710 826
186 63						-	969 724
1867-68							2 628 10
187 73							4 858 162
1877 78							5 362 267
1882-83	•	•		•			7 274 000

The fore gn exports of raw jute were, in 1882 83 10 348 909 cwt

1910

senting an increase in value from R620 to R5 84 69 259 in the short period of 55 years (eg, from £62 to £5 846 925 for exported raw jute alone) speaks volumes for the noble fleet of merchant vessels trad ng with our Ind an ports Mr Hem Chunder Kerr, in his valuable Report on

the held of European commerce

The figures of Indian trade show that the exportat on of jute steadily increased from 1 og 603 cut in 1850-71, that in 1871 72 it suddenly rose to 6 133 313 cut, and during the past

5 years has preserved an average of about 7 274 000 cwt

In 182 83 Ind an commercial men calculated that on an average Scotland consumed over 18 400 bales (7,600 cat) a week Of three Messrs Cox Brothers take 2200, Messrs Glroy & Sons 700, Messrs Macloim, Oglve & Co, 6,00, Mr John Sharp 700 In England the weekly consumption is over 1800 bales, the largest consumers being the Barrow Company, 600 In Ireland the total weekly

1911

#### CORCHORUS.

#### The Inte Fibre

EXP	ORTS
-----	------

consumption is about 730 bales, the largest firm consuming under 300 bales a week. Thus Great Britain requires over 21,000 bales or 81,000 cwt a week, or 4,200,000 cwt a year to keep her existing jute factors.

1012

consumption of 195,000 cmt. The Scotch power-looms alone consume 73,000 cmt. a week, or 3,710,000 cmt. a year. Although in some respects this estimate has been disturbed, it is relatively correct for the present year 1887-88.

France requires 4,000 bales a week, its largest consumer, Sant Frersy, requiring 700 bales; Germany requires 2,170 a week, of which the Brunswick Jute Spinning Company consume 770 bales; Belgium requires 8,15 bales a week; Austra, S80, Spain, 250; Holland, 400; Norway, 100. Taking annual figures for the whole of Europe is found that Grat Britain and the Continent of Europe require 1,800,000 bales a year, of 2,428,580 ext. It may be here stated that as merchants adopt the caleridar year, and Government the financial,  $\epsilon_R$ , from April to March, considerable difficulty has been experienced in companing the Government Statistical Tables of Exports with those kindly supplied by one or two well known jute firms in Calcuita.

1913

Comparing with the above figures the 22 Indian factories at work in India in 1832-83, or 600,000 bales . How the compared that to keep thes up to the compared to keep the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the compared to the com

were required, a saumed by America, Australia, and other foreign countries, vis, booked bales, or 2,142,498 cut, not included in the above calculation, the annual bales, or 2,142,498 cut, not included in the above calculation, the annual bales, or 2,142,498 cut, not included in the above calculation.

Annual Capital. 1914 Looking at the exportation of raw jute, of manufactured jute, and the home (Indian) consumption known to our commercial men, the statement hat the jute trade is at least represented at the present date by annual consumption of over 15,000,000 cevt. of raw jute does not seem to be far from correct This is roughly equivalent to an annual turn over of capital equal to about 12—14 millions of pounds sterling as compared with the exports in 1828 of £62.

dles, and they give employment to 29,660 men, 11,198 women, 5,113 young persons, and 3,044 children The Madras private jute company employs about 878 persons. Thus, up to the present date, there are in all India 24 Jute factories, which give employment to 49 015 persons and use up 2,869,088 cwt of jute They are almost exclusively employed in the gunny bag or cloth trade, three only doing a small business in cordage, floor cloth, or other manufactures

In 1970 thoras and a England of toron - Son land 00. in Ireland ale spindles, and In India there

t the details of every individual factory. Judging from the published statistics of intefactories in Scotland during the year 1879, and comparing a fixed number of these with the Indian factories for the same year, we may, however, conclude that the Indian mill workman was inferior to the Scotch work-man in the ratio of 3 to 7. That is to say, it requires 7 persons to work one loom in an Indian factory, against 3 workmen in a Scotch factory This conclusion is arrived at by dividing the total number of persons employed in a factory by the number

age for all Scotch factories and the av course this calculation is open to th factories not manufacturing the sam

market for jute goods

may be accepted as giving some sort of comparison,

FORFIGN TRADE IN MANUFACTURES.

Prior to 1857 the exports of Jute manufactures from India represented hand loom fabrics In 1850 these were valued at £215,078, whereas the trade in raw jute was only £197 071 Fifteen years later the manufactured jute, exported to foreign countries, was valued at R18,27,983 (£182,708) and the raw jute at R75,06,690 (£750 669) In 1870-71 the exports were of manufactured jute R34,24,249 (£342,424) worth and of raw jute R2,57,75,526 (£257,755) But the revival in the exports of manufactured jute indicated by these figures, as also the partial decline of the foreign raw jute trade, was at once the death of the old hand-loom industry and raw jute trace, was at once one cracking in the our manuscomming manuscy and the both of the new power-boom. Ten years later (1880-81) the total exports of manufactured jute were valued at R113 06,716 (£113,071), of which the hand looms produced R2,05,553 (£0,0553), and last year they were valued at R113,15,577, (£145,15,57), of which the hand-looms produced R0,06,053 in these figures include the manufactured by the growth others (180,000,000,000). of the Indian power loom foreign trade and the decline of the hand loom In a further page some idea will be given of the extent of the home

### CLASSIFICATION OF THE JUTE MANUFACTURES

CLASSIFICA-TION OF MA-NUFACTURE. IQ2I

The manufactures from tute or pat may be referred to three primary sections -

These three sections may each be referred to a number of sub-divi-sions, which for convenience may be arranged in two leading groups, urs, native and indigenous manufactures, "hand loom," and European or, "power loom" manufactures, whether made in Europe or in India We shall first enumerate the indigenous manufactures, since these bear on the history of the industry,

#### INDIGENOUS MANUPACTURES

20

The Jute Fibre.

CLASSIFICA-TION OF MA-NUFACTURES 2nd, Fine cloth —This is generally known by the name of mills dhokra, and is chiefly used as a cloth to sleep on, it is often beautifully

striped blue or red
3rd Coarse cloth -This is largely used for making the sails of country

boats (gun), and also for bags to hold large seeds or fruits

The following are the principal districts in Bengal where indigenous jute manufactures (hand-looms) may be said to exist to any considerable extent —Hugli, consuming about 1,20 oon maunds of jute a year, Dacca, 00,000, Rungpore, 50 000, Morshedabad, 38,000, Malda, 25 000, Julaagun, Pubna, &c., smaller quantitus

European Manufactures, 1023

### EUROPEAN MANUPACTURES

Cloth made in Reatories — Jute is now largely used in the manufacture of carpets, curtains, shirtings, and is also mixed with silk or used for imitating silk fabrics. It has been applied extensively as a substitute for hemp for this purpose the fibres are rendered soft and flexible by being sprinkled with water and oil, in the proportion of 20 tons of water and 2) tons of train oil to 100 tons of jute. Sprinkled with his the jute is left for from 24 to 48 hours, when after being squeezed by rollers and heatbay, the fibres become beautifully soft and munitely isolated, and thereby

the

and and other fibres were not adulterated with jute. In 1832 an enterprising Dundee manufacturer experimented once more on the fibre, and the result was that he was able to show that it might be used as a substitute for hemp. From that date jute gained rapidly in public favour. It is

2015	desirable to leave the available information in its present form, since it by no means established that Costus speciosus is not used as a substitut for Saussurea.  § "Piesse's remarks must apply to Aplotaxis (= Saussarea), not to
MEDICINE Tubers. 2016	roots are quite insi  s a depurative and ild be always serect tubers of Costus speciosus are regularly used by the natives of Ind shot as food and mediane. The late Dr. U. O. Dutt. wrote on the margin o a copy of the at the Calcut (where a brief Saussurea is b ven, — lins tool is said to be bettel, astringent, and
	pam in the intriow the p writer and was Costus, not Saussu alluded to, Dr Dymock says —
	The kursures, but success the subject, although they bear no resemblance to each other) perhaps for the past 200 years, but at the same time there is a certain amount of Costus specious root deliberately used, and not from any idea of adulteration with the supposed Costus of the uncents. Sir Water Elliot gives several Sanshrit synonyms for Costus speciosus. He may have been mistaken as to these synonyms but he dealy recognised what the Costus speciosus of botanists ment, as he decreased the plant. He refers to Rashurgh's Flors Indica Vol. 1. 8 of the Coronnadel plants, page 126 and states that while Robert root in these works gives Bomma Rachehaka as the Telegu for Zurgenstein these works gives Bomma Rachehaka as the Telegu for Zurgenstein which abounds in the forests of this province. The Sankrit synonym which abounds in the forests of this province. The Sankrit synonym and the support of the Sankrit synonym and the support of the Sankrit synonym the Costus." He further gives Rasmramu is another Sankrit synonym to Costus."

## Crinum, sp. (found in Chuna Nagpur )

Mr. C B. Clarke writes of this plant that he is unable to name it and presumes it may be an updescribed species. In that case it should bear the discoverer's name—the Rev A Campbell. Mr Clarke also informs the writer that he has collected another species in the tanks of Chutia Nagpur which flowers in November, he views this as distinct from the common Sunder-band species, which flowers in May

Vern.-Sikvom baha, Santal

Habitat - High and dry situations in Chutia Nagpur, flowering during the hot season before the leaves appear. In some respects, this resembles C latifolium as described in Roxburgh's Flora Indici

Medicine -Mr A Campbell says "The bulb is sometimes as large as a good-sized turnip, and of the same shape. A decoction prepared from it is given internally and pounded and made into a paste, it is also applied externally by the Santals in dropsy. It is used for the diarrhea of cartle "

C. zeylanicum, Linn, Wight, Ic 2019-20

highly thought of as a remedy for catarrhal affections of children, and is used in certain Indian dishes as a colouring agent. Mullahs (priests) make a kind of ink with this substance with which they write charge. (Dr. Emerson) In over doese it is generally reported to act as a narcotic poison. Annile gives perhaps the most complete account of the native uses of this drug, and of the opinions which prevailed among

torius)

Chemistry — § "The colour of saffron is due to the presence of a glucoside polychroit, which is decomposed by acids, with the formation of a new colouring principle Crocin' (Prof Warden, Calcutta) For full particulars as to the chemistry of this drug see the Pharmacographia, p 666.

Trade in Saffron -The imports of foreign saffron were in 1882 83, 226 cwt valued at R1,25,121, and in 1886 87, 268 cwt valued at R5,50,383 Of the Indian imports the bulk comes from france

## CROPS.

An important feature of Indian Agriculture is the fact that, through the presence of extensive montane tracts, India possesses considerable areas that are under temperate indiances, as well as vast expanses that are purely trop cal. Between these two conditions almost every possible gradation exists in which the tendency to extreme humidity or extreme aridity modifies the general character. From this point of view alone

nus are separately reported. It would thus appear that the term "Bombay hemp" is often, though incorrectly, given to the Ambadi fibre, Bibszes canabinus. It is thus unfortunate that, in modern commerce, the term "hemp" should ever have come to be applied to any but the true hemp plant, as, by this usage, widely dissimilar products have been almost hopelessly confused. The sunn is a bust closely allied to the English broom or the Indian dad, while the ambari is a Hibscus or cotton-looking plant with sharply-cut leaves not unlike those of the hemp plant,—hence the specific name cannabinus. The true hemp has its nearest affinity, of fibre yielding plants, in the common nettle. The hemp fibres thus afforded by these three plants have little or nothing in common.

orefer to cultivate sunn hemp (Crotalaria juncea) or san-pat (Hinstusi canabinus) for the cordage and sacking required for agricultural purposes. There is still a further consideration, and one of some importance,—us, that on the plans of India the hemp plant does not produce fibre of any value. Unless, therefore, we are to presume thirst it has degenerated, or that the climatic conditions of India have altered, the ancent people of the plans were not likely to have oblamed their sans fibre from Canabis.

We may conclude this brief historic review of the hemp plants by grying the opinions that prevail regarding the origin of our word "hemp."

#### Cultivation of Sunn-Hemp

CROTALARIA juncea

Royle in his Fibrous Plants of India traces hemp from sana Speaking of sunn-hemp he says "Its name, Shanapam or Janapa on the Madras side, is not very unlike Canapa, Hampa, Hennip and Hanf From these we derive our own name 'Hemp'" in Mysore it is known as sanabu and i

#### CULTIVATION.

CULTIVA-TION 2100

Sunn is grown by itself or at times is cultivated in strips or around the margins of fields. It is never cultivated as a mixed crop. Throughout India as a whole it is a kharf crop—that is to say, it is sown about the commencement of the rains and cut at the end of September or beguning of October. It is thus off the ground to allow of being followed by a rabs crop in the same year. But in some parts of India there are two crops of samn hemp. Thus in the Thana District of Bombay it is sown in November after the rice harvest, and the stalks are pulled up by the root in March. "It is also sown as a rainy season crop in sandy soils" (Gaz, \( \lambda III, I, 290 \). This system has prevailed in

## CULTIVATION.

ULTIVA-TION. 2100

Sumn is grown by itself or at times is cultivated in strips or around the margins of fields. It is never cultivated as a mixed crop. Throughout India as a whole it is a kharif crop,—that is to say, it is sown about the commencement of the rains and cut at the end of September or beginning of October. It is thus off the ground to allow of being followed by a rabi crop in it is same year. But in some parts of India there are two crops of sunn hemp. Thus in the Thana District of Borbaby it is sown in November after the tree havest, and the stalks are pulled up by the root in March. "It is also sown as a rainy season crop in sandy soils" (Gas. YIII, 1, 20). This system has prevaled in Thana and Sunt and the stalks are the control of the stalks are sould be supplied to the stalks are some soils." (Gas. YIII, 1, 20). stalks are up.

tones in Marcin. In romajour it is sown in August and arrested in December by being cut when the plants are full grown. In Poons it is sown in July and ripens in October. In the Central Provinces and the North-Vest Provinces is a kinary fron, being sown with the advert of the rains, but in Bengal it is sown a little earlier, namely,—from the

mean period of sowing is about the beginning of the rains for in Jure), saw themp may be sown in almost any month and occupies the soil for 4½ to 5 months. This is an important feature in wew of the possibility of scenting a continuous supply of fresh fibre throughout the whole year. It remains to be ascertained, however, what effect this varying period of cultivation has on the quality and quantity of fibre produced. Indeed, it is probable that (as is the case with rice and other rops) sown at two or more seasons each year) there may be different cultivated forms of the plant produced as the result of ancient cultivation. We are ignorant of this subject, and it seems des rable that a thorough investigation should be made. Although, as stated, everything points to furn hemp being at

ROTALARIA iuncea

Cultivation of Sunn Hemp

CULTIVATION OF Soll 2110

native of India, it may be doubted if the plant has ever been found in a And the existence of distinct cultivated forms might not only help to confirm the opinions given of an ancient cultivation, but might also establish the superiority of certain crops over others for textile purposes To what extent the form C. tenuifolia is cultivated is not known still less do we know how far it affords the superior sunn hemp referred to by writers on this subject

Nature of the Soil recommended for Sunn hemp -It requires a light but not necessarily rich soil, and it cannot be grown on clay It is therefore sown on the high sandy lands less suited for the more important crops This is the opinion which prevails in Bengal, but Messrs Duthie and Fuller, writing of the North-West Provinces, say "Authorities differ as to whether a rich so lis necessarily required, and y in the soil is necessary to

et it cannot be contested that st any other crop One poscory that plants of this order"

(the pea family) "can assimilate nitrogen direct from the atmosphere, and are hence less dependent on the soil for nourishment, and another explanation may be deduced from the fact that its roots penetrate deeper than those of most other crops, and can hence draw supplies from a larger body of soil." At the same time the practical experiments performed at the Saidapet farm, Madras, tend to prove that the plant would not produce so much fibre on rich as on poor soil Speaking of these experiments Mr Benson says "The seed germinated well, and the plants grew with great luxunance, but when they had reached the time for cuttin~ L The soil of this plot was a ion and watering were unfav \*cond experiment was performed, the seed being sown on "a light and very sandy loam recently levelled". The land was manured with "12 loads or about 4 tons per acre" of horse manure and the results were most favourable. In the Mysore Gazetteer it is a ated that the best soil for sanabu is the red or black

used for ragi cultivation Wisset remarks that clay so is are injurious, but that on a rich soil the fibre is c dry high situations On the oth the cultivation in the Northern C is sown towards the end of the ra

strong clayey soil suits it best

Rotation ZIII

Effects of Sunn Cultivation and the Rotation of Crops Pursued - It is all but universally believed by the Indian cultivators that sunn, I ke gram (see Cicer, C No 1067), improves the soil In the Bombiy Gasetteer (Kolhapur District, p 172) it is stated "As it is supposed to refresh the exhausted so l, it is considered a good bevad or preparatory crop, and is grown as such every second or third year in some of the fields required for sugar-cane, tobacco, and other rich crops Sometimes it is sown as a second crop and ploughed in when young as a green manure" From Poona it is reported that the leaves are considered 'excellent manure' In gardens and occasionally in dry crop lands it is grown solely for manure, the plants being ploughed into the soil when ready to flower." The Director of Agriculture in Bengal states "It is considered by the people of the Lower Provinces to be a renovating crop, and is cometimes used as a green manure to enrich poor paddy land and land that has been infested with weeds" He adds 'It comes after one of the pulses or mustard, and is followed by a pulse, sometimes by shara onions When sum is grown on good soil, it is sometimes followed by potatoes. It is not necessary to prepare the land well for sunn Three or four

Cultivation of Sunn-Hemp.

CROTALARIA iuncea.

"Sometimes also paddy and sunn seeds ploughings are sufficient " are sown together in the same field. When the plants have properly grown, the field is lightly ploughed and the ladder (a kind of harrow) is passed over it. The paddy plants mostly recover themselves, but the tender and juny sunn is buried underground and dies. A few sunn

CULTIVATION FIRRE.

Messrs Duthie and Fuller say of the North-West Provinces "Ploughing in a green crop of hemp is known to add considerably to the fertility of the surface soil by increasing its stock of nitrogen, and it is extraordinary that this is not a general practice with native cultivators." In

Bombay tag (sunn) is not considered a good green manure for wheat Tillage. Sowing, and Harvesting -As indicated above, the opinion TREATMENT. prevails all over India that high cultivation is not necessary for sunn-hemp Of Kolaba (Bomb Gaz, AI, 97) it is said "The soil is roughly ploughed twice and the seed sown broadcast" In Rengal tibe cond

## Area under Sunn-Hemp

CROTALARIA iuncea.

The produce was sold by the cultivators to the Telinga Chitties or manufacturers by the thousand handfuls of the dried stems, tall plants fetched two rupees per thousand handfuls, and short plants a rupee and a half Butanother crop, he says, was sown in January This crop had to be watered and more labour spent upon it, but the produce was more valuable An'acre, he says, required 476 bushels of seed, and its produce was

sold for about £1 2s 101d

ARPA UNDER SUNN-HEMP -As may be inferred from what has been stated regarding the ambiguity in the Indian literature of this subject, it is next to impossible to discover the extent of sunn-hemp cultivation Messrs Duthie and Fuller, from special returns furnished for their Field and Garden Crops, state that in the North-West Provinces there are about 40,000 acres under the crop But in the Land Administration Report for 1885-86 (page 163 A) it is stated that there were 198,728 acres under "Sanai or Til (sic)" But it is further remarked that the total area under "fibres other than cotton and jute" was in that year only 123,403 This last return would include hemp (proper) sanas and Hibiscus cannabinus The Settlement Reports of Oudh show about 800 acres under sana: In Spons' Encyclopadia it is stated that there are 50,000 acres in the Panjab It is not known from what source that statement was derived, but Panjab Panjab 50 000 acres. it seems highly ir- Li Last than in the Nortl give true

fibre is produced, but it is not known to what extent the plant is cultivated. In the Central Provinces there were 24,800 acres under "False or San hemn" and in Mys under 'hem

explains tha The former

In Burma and Assam there are about 500 acres, in each province, of land entered as under "fibres other than cotton and jute " No returns are available for Bengal, but from personal observation the writer would be disposed to think there must be as much in the Lower, as in the North-West Provinces

It will thus be seen that the actual area under sunn-hemp cannot be absolutely determined, since the fibre is not included among the agricultural products regarding which regular annual statistics are furnished it seems probable that there are at least 150,000 acres annually under the crop in India as a whole

SEPARATION OF THE FIBRE

The question as to whether the plant should or should not be dried before being placed in the retting tanks having been discussed above, there remains to be given here a brief account of the various modes of retting or of peeling the fibre and of cleaning and boiling it after it has been separated from the stems In some localities the stems are recom-

In others stagman water is condemned as destroying the colour and lustre of the fibre running streams being urged as preferable (Gisbon's account of the Bombay fibre). But practical and comparative experiments not having been performed in the other prowinces similar to those made at the begin-
Leaves stripped	nung of the present century by Roxburgh, in Bengal a definite opinion for or against the different methods pursued cannot be offered. After removal from the ground, the stems are ted in bundles (20 to 100 in eith), but the leaves are generally stripped off and left on the field When the stems are left until quite dry, the leaves either fall off naturally or are removed by the stems being beaten. It is a common practice to place the bundles of stems recet in 20 rs inches of water for 21 hours.
Length of submersion	so as to give the thicker and lower ends a longer submersion. But the length of time required for retting depends largely on the temperature

CROTALARIA iuncea.

employed "The plant while moist is peeled by the hand, and immediately dried in the open air or under cover, according to the state of the weather By peeling, the fibres are better kept in their natural state of arrangement, and give support and strength to each other, whereas, by the process of the Bengalese, they get so materially entangled that a great loss is always sustained. If they are restored to their natural situation by the heckle, there is a loss of nearly one half of the original quantity, which renders the heckled sunn of Bengal of a high price" The writer cannot discover any recent description of this Bombay process of separating the fibre without retting, but, as Roxburgh stated, the superior quality of Bombay over Bengal sunn hemp seems likely to be due to the fact that the fibre has not been subjected to strong fermentation

SEPARATION

FIBRE. Not Retted.

Washing the fibre is very tedious, and a man rarely works for more than three hours at a time but is relieved by turns, he will clean is seers a day, which represents the fibre obtained from 5 or 6 maunds of stems Wages for cleaning.

Of Khandesh it is said a man earns R1 for cleaning 40th of fibre Reference has incidentally been made to the period when the crop should be cut, and before proceeding to discuss the further treatment of the fibre it may be as well to add here that the period of cutting will govern why were cï equired' A softer and more just as the flowers appear Period of cutting.

Soft fibre.

A few plants are always icit by the cultivators to mature seed for the next year's crop, and from the stems of these they extract a strong, though coarse, fibre On the other hand, it seems to be the habit of some cultivators (the Wuniaras of Bombay) to allow the whole crop to ripen its seeds, this coarse fibre being all they desire, together with the seeds, which are valued as a food for buffaloe food

separation from the ster quotes a report of a sample of sunn hemp experimented with at Hull of which it was stated that 'by using more care in the steeping and exposure, it will be fully equal to the Baltic." Such opinions are current in the reports of this fibre which appeared while the error existed of supposing it to be Indian grown hemp or Cannabis sativa It is impossible to avoid the impression that sunn hemp fell into disfavour when this error was exploded An expert in 1842, for example, says "Your hemp is very clean-a material point-but it wants more beating and dressing, and I think the natives have not proper implements to do it with You cannot improve in your mode of packing, it is decidedly superior to the Baltic I do not despair of seeing the produce of the Biltic supplanted by that of India, as that defect appears to me solely to arise in the management of it it stands too long before it is pulled or cut, or is too much steeped or exposed, to get the fibre to separate from the stalk." Unfortunately the advances of scientific exploration told all such writers that the defects they complained of were due to the fact that Bombay hemp was not hemp at all, and instead of the fibre supplanting

Deterioration with age. According to these experiments sunn hemp stood the action of the macration better than did either of the samples of true hemp. It has further been shown that a cord 8 inches in size of best Petersburgh hemp broke with 14 tons, 8 cwt, 1 qr., wh le a similar rope of sunn only gave way with 15 tons, 7 cwt, 1 qr. Dr. Wight found that a rope of cord of a certain thickness broke with a weight of 224b, of cotton with 340b, of American also with 365b, of sunn hemp with 497b, of Calatropis gigantes with 535b, and one of Ambari (Hibisus canabinas) with 395b. Royle has shown the slight deterioration which sunn hemp undergoes, in the following statement: "A rope made in 1805 broke with a weight,"

Removal of Export Duty

sent century the bulk of the exports of raw hemp (1 sunn hemp) went from Bombay and not from Bengal, in spite of the efforts made a few pears before that date to create a Bengal trade. This nould seem to point to a superiority possessed by the Bombay as compared with the Bengal sunn hemp. It seems probable that had this fact been realised by the East India Company, their efforts to establish an Indian hemp industry would have been more successful than was the case with their attempts in Bengal.

RECENT EX

Injured by

In a Report on the Indian Fibres by Cross, Bevan, King, and Watt, recently published by E and F. Spon, the following passage occurs: "It is impossible to urge too strongly the claims of this much-neglected fibre—a fibre which seems to have suffered severely through the immense.

that so httle of the better qualities of sunn-hemp were procurable. Mr. Collyer and several other Brokers and Merchants stated that their only

make a nice clean, smooth paper, of good colour, but not taking ink well " For European purposes the fibre may be used as a substitute for hemp or for flax. Speaking of the special form of the fibre produced in

Travancore, Dr Royle says "The appearance of this fibre is totally different from any other which comes from India, as it is in the state as if prepared for spinning into thread, and must have been combed The fibres are brownish in colour, about 3 to 4 feet in length, clean and shining, not so fine as flax, but still resembling some of the coarser kinds A very competent judge informed the author that it might be sold for the purposes of flax, or as a kind of flax, and was worth £35 a ton, so some specimens sent to Dundee were valued at the same suin, and it was said could be used for the same purposes as flax, though rather too dry." So, again, "This hemp, when prepared with the patent liquid, became soft, white, and so fine when heckled as to bear the closest comparison with flax at \$80 per ton It is better than any Russian flax for fine spinning Bombay hemp, rough and dark, and This article, being similarly prepared, was valued at £20 per ton

considered equal in value with the Madras hemp Sunn stalks (after removal of the fibre) are used chiefly as fire-But of the Kolaba district, Bombay, it is stated "Hemp torches and stalks with

antiquity of the species in Europe. There is even an Esthonian name, Uggantri ukhurti, urits. It does not seem to be Finnish, but to belong to the same Aryan root as aggourne. If the cucumber came into Europe before the Aryans, there would perhaps be some name peculiar to the Basque language, or seeds would have been found in the lake duelling; of Switzerland and Savoy, but this is not the case. The peoples in 1the neighbourhood of the Caucasus have names quite different to the Greek; in I artiar kiar, in Kalmuck chaja, in Armenian karan. The name this exists also in Arabic for a variety of the cucumber. This is, therefore,

2292	and if so the further suggestion might be offered that it may after all prove but a peculiar form of Cucanus sativus. Most if not all the forms of						
CULTIVA- TION 2293	might be trick in admition to the preparation of carefully dried specime 3 both of the natural and hybridised plants.  Cultivation—These plants are alluded to by many writers, but it is scarcely necessary to repeat all their statements. The following abstract from the hadran Foretire (written by Mr. Gollan, Supennendend, Betaine Gardens, Saharanpur) gives some particulars regarding the cultivation of hot season excumbers or pherkins—  "This is a variety of the common excumber, with small eggs-shaped should be sown along both sides of the drill, and if the soil be dry, mater should be given immediately after sowing. After germination, water should be given immediately after sowing. After germination, water						
	every ten days, but like the kaker this vegetable should not be watered too often." (Vol. IX., 162)  Regarding the rainy season forms Mr. Gollan (Ind. Fer., IX., 201) asys they have much larger fruits and are more like the English cucumber; there are two forms,—"when in a young state the colour one is a dark green, and of the other creamy-a hite; when full grown,						

both are about a foot long, and the colour changes to a rusty brown. These two, although not equal to the commonest varieties met with in England, are not to be despised. They thrive with little care and are oblives unversely religing a cross. always sure of yielding a crop Firminger, in his article on Cucumber, deals fully with the two forms of the rainy season plant, but was apparently ignorant of the hot season one or did not view it as a cucumber. Speaking of the rainy season forms, he observes of the bitter sort that it "is of smaller growth and of a

creamy-white colour when young, furning to a rusty colour at the ends as it ripens. This answers nearly to the description of the one called the 'White Turkey.' It is the better of the two for stewing, cooked in which C. 2294

Habitat - A native of the central tracts of India, from the mountains of Bengal to Bambas and Madras. Is particularly abundant in the Central Provinces, and a considerable trade is reported to be done at Ra pur in the collection of the tubers. The plant is all a common at Ram that, Bombas Is es d to grow wild in North Canara (Bombas), Lui to be also cultivated (Gaz., Al., pt. 11, 20) Mr Atkinson remarks that, it is

#### Wild Arrowrect.

CURCUMA angustifolia.

found wild in the North-West Himalaya The flowers are large and yellow, longer than the bracts, they expand in the morning and wither in the evening of the same day

Cultivation of East Indian Arrowroot.-Perhaps the most complete accounts of the cultivation of this plant are those which will be found in the Reports of the Sydapet Experimental Farm, Madras The following

2386

Madras Rootstocks. 2387

the above yield would represent an outturn of 403lb of flour per acre In another case in the College Experimental Garden, a plot, measuring 1,160 square yards, planted with this crop yielded 1,798h, or at the rate of 7,500h per acre The culture of this crop is very simple: it is only necessary to plant the sets in properly prepared soil, and to water them occasionally during the dry season. The removal of the crop is tedious unless the tubers can be ploughed out, as potatoes are done in England, which is seldom possible owing to the dryness of the soil, so that the tubers have to be dug up. The preparation of the flour is also very simple and easy The TUBERS have only to be reduced to pulp on a grater, after being well washed to remove soil and dirt, and then the pulp is mixed thoroughly with water so as to separate the starch completely from the fibrous matters The whole is afterwards strained through cloth, through which the STARCH and water passes, and the fibre left behind. After this the STARCH has only to be thoroughly washed by decantation with clean water, and dried in the sun. It is then rolled on a table to break it up thoroughly into fine flour and is ready for sale. The flour can be produced at a very low price; it could be sold profitably at 4 annas per pound. And thus 400 rupees per acre could be realized. This is a remarkable return and should also be published for the information of the

Starch. 2388

Profits Rs. 400 an acre.

rhizomes It is the well-known halds universally used as a condiment with curry-stuffs and also as a dye, and is one of the most profitable of crops The dye-yielding rhizome is harder and much richer in colour than the edible. These conditions are thus special adaptations which possibly point to an ancient cultivation. At the same time, though several species of Curcuma are undoubtedly natives of India, some of which appear to have been mistaken for the true turmenc, there is little of a positive character that would justify the supposition that Curcuma longa itself is a native of India Simmonds (Tropical Agriculture, p 383) says "The Carcuma longa grows wild in the province of Mysore, and is probably indigenous to various other parts". On the other hand, Roxburgh and all botanical writers speak of it only as cultivated, and Ainalie even remarks that "The Curcuma lenga grows wild in Cochin-China, and is there called Knong huphh Loureiro gives us a long list of its medicinal virtues in lepra, jaundice, and other disorders -L 4L at It is

superseded some of the indigenous Curcumas formerly in use and which bore the names now given to this plant, just as the true arrowroot plant is rapidly displacing the indigenous or East Indian species

to him was little besides manure and seeds; but the value of the crop could not have been much under RISO, and was possibly more."

### PREPARATOIN OF THE RHIZOME.

Various systems are apparently practised for preparing the rhizome for the market. Of Bengal it has been said:—"After the rhizomes have been dug out of the ground, they are freed from the fibrour roots and clear."

PREPARA-TION. 2450 BENGAL. 2460

3,500

55,500

Regarding the Indian Foreign trade in this article Mr. O'Conor, in his Review of the Trade in 1873-77, wrote "Turmeric was exported to the value of too lakks of rupees, the quantity being 12,822 cxt. This article has hitherto been recorded in the returns under the heading Spices, but it is more appropriately classed as a djeing material It is not really a spice but rather a condiment, and for this purpose

Foreign. 2466 portance in 1881-82 the exports were 70,783 cwt, valued at R3,66,047, as compared with 1877-78, when they amounted to R12,40,189 in 1855-86 the trade had so far recovered itself that the exports amounted to 156,287 cwt, valued at close on 11 lakhs of rupees. Last year they amounted to

Internal. 2467 140.091 cnt., valued at Rio, 22.02
Full particulars cannot be learned as to the extent of the internal trade, but it must be very extensive, and even a trans-frontier trade exists. Kashmir receives a considerable amount. The various Indian ports last year exchanged 281,117 cnt. of turneric valued at R44,83.200.

HISTORY 2468

#### HISTORY OF TURNERIC

Turmenc yields a yellow dye of a fleeting character, which formerly was far more extensively employed by the natives of India than at the present day. Its chief features that recommended it for decorative purposes at marriage ceremones, &c., were cheapenss, case of reparation, and facility of being removed. But these are conductively more readily attained by aniline colours, while glaringly brilliant results are obtained, and, consequently, even relig ous injunctions have

Turmeric,	CURCUMA longa.
to a certain extent given place to the encroachments of the tar dyes. Writing of this subject Dr. McCoann (in his Dyes and Tans of Bengal, p. 85), says: "Formerly on festive occasions an infusion of turmeric	HISTORY.

the trade of Lochin, makes no mention of lurmeric, but at the same time references occur, of turmeric as employed in Europe about the time of which I Incohes -

can am part a une oform, the inner substance is horny and of a deep orange-brown, or when in thin shavings of a brilhant sellow Mr A Forbes Scaly of Cochin has been good enough to send us (1873) living rhizomes of this Curcuma, which he states is mostly grown at Alnaye, north east of Cochin, and is never used in the country as turmeric, though its starchy tubers are employed for making arrowroot" (Conf with C angustifolia and other sources of East India arrowroot)

TURMERIC DYE DYE 2474

Dve -It has already been stated that a special form of turmeric is grown for this purpose, namely, a harder root, much richer in the dye principle than in the ordinary condiment form. This dye rhizome receives separate names in the various provinces of India, but is most generally known by the name lok hands halads, other dye forms are as mæla-halds, jowala-halds, and ambs-halds Under the paragraph, above devoted to an account of the preparation of the tuber, mention has also been made of the further process which the dyer has to adopt in

The colour is only deposited in the rhizome with age, and hence, in all probability, the above mentioned forms have been obtained by a process of careful selection of stock observed to produce the colour freely It is of importance, however, that the European merchant, in purchasing for dye purposes, should see that he gets the hard dye-yielding form and not the softer aromatic condition which is used as a condiment. Although, of course, turmeric is still employed by itself as a simple and cheap dye, its more general use at the present day in India, is as an auxiliary to other dyes and in Calico printing It is also used to some extent to impart a colour to native-made paper Mordants are but rarely required with the dye, as it is found to attach itself readily enough to wool, silk, or cotton. Alkalies deepen the colour, making it almost red. Alum is said to purify the colour and to destroy all The dyers of Calcutta produce a brilliant yellow, known shades of red (Carbonate of Soda)

this process tint, produced always is are sometimes em-

ployed with turmeric, but the chief compound colour in which turmeric plays an important part is the green shades formed along with indigo.
The fabric is first dyed with indigo and then dipped in a solution of held!
Turneric is also often added to sharpen or brighten other colours, as, for example, Singrahar (Nyctanthes arbortristis), fac dye, al (Morinba tinctoria), safflower (Carthamus tinctorius), and toon (Cedrela Toona).

Habitat.—Cultivated in many parts of India from the Himálayas to the Western Peninsula. It is a robust erect annual, 2 to 3 feet high, grown as a rainy season crop.

Cultivation. - In the Bombay Gazetteer (Gujarat) it is said to be grown as gn and it

CULTIVA-2515

different purposes,-as a vegetable for human consumption, and as a pulse for horses and cattle. For the former purpose it is invariably grown on highly manured land near villages, and assumes a much more luxuriant habit of growth than when grown for cattle The portion eaten as a vegetable is the pod, which is plucked while green, after the fashion followed with the French beans of English gardens. As a cattle fodder it

as an arromatic pla is mentioned in the litid (21, 351), and Odyssey (1, 603), and by Theophrastius in his fourth book, it appears to have been a favourite food of horses. Pliny (21, 18) calls it Jenus transgulars or angulous; it is probably the Juneus of Celsus (3, 21) mentioned as an ingredient in a directic medicine for dropsy, although he calls it Juneus quadratus" (Obymock, p. 844). Arabian and Persian writers describe the drug as a merit of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the drug as the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of the call of
